3/3.3/4.0 V μP Supervisor Circuits

General Description

The ASM706P/R/S/T/J and ASM708R/S/T/J are cost effective CMOS supervisor circuits that monitor power-supply, battery voltage level and μP/μC operation.

The family offers several functional options. Each device generates a reset signal during power-up, power-down and brownout conditions. A reset is generated when the supply drops below 2.63V (ASM706P/R, ASM708R), 2.93V (ASM706S, ASM708S), 3.08V (ASM706T, ASM708T) or 4.00V (ASM706J, ASM708J). In addition, the ASM706P/R/S/T/J feature a 1.6 second watchdog timer. The watchdog timer output will trigger a reset if connected to $\overline{MR}$. Floating the WDI input pin disables the watchdog timer.

The ASM708R/S/T/J have both active-HIGH and active-LOW reset outputs but no watchdog function. The ASM706P has the same pin-out and functions as the ASM706R but has an active-HIGH reset output.

A versatile power-fail circuit, useful in checking battery levels and non-5V supplies, has a 1.25V threshold. All devices have a manual reset input. All devices are available in 8-pin DIP, SO and the compact MicroSO packages. The MicroSO package requires 50% less PC board area than the conventional SO package.

Features

- Precision power supply monitor
  - 2.63V threshold (ASM706P/R, ASM708R)
  - 2.93V threshold (ASM706S, ASM708S)
  - 3.08V threshold (ASM706T, ASM708T)
  - New 4.00V threshold (ASM706J, ASM708J)
- Debounced manual reset input
- Auxiliary voltage monitor comparator
  - 1.25V threshold
  - Battery monitor / auxiliary supply monitor
- Watchdog timer (ASM706P/R/S/T/J)
  - Watchdog can be disabled by floating WDI
- 200ms reset time delay
- Three reset signal options
  - Active HIGH: ASM706P
  - Active LOW: ASM706R/S/T/J
  - Active HIGH and LOW outputs: ASM708R/S/T/J
- DIP, SO and MicroSO packages
- Guaranteed $\overline{RESET}$ assertion to V_{CC} = 1.1V

Applications

- Computers and embedded controllers
- CTI applications
- Automotive systems
- Portable/Battery-operated systems
- Intelligent instruments
- Wireless communication systems
- PDAs and hand-held equipment
- Safety systems

Pin Description

Pin Number						Name	Function
ASM706P		ASM706R/S/T/J		ASM708R/S/T/J			
DIP/ SO	MicroSO	DIP/ SO	MicroSO	DIP/ SO	MicroSO		
1	3	1	3	1	3	$\overline{MR}$	Manual reset input. The active LOW input triggers a reset pulse. It is pulled HIGH by a 20kΩ pull-up resistor. It is compatible with TTL/CMOS signals when V_{CC} = 5V. It can be shorted to ground through a mechanical switch. Leave floating or connect to V_{CC} if the function is not used.
2	4	2	4	2	4	V_{CC}	Monitored power supply input.
3	5	3	5	3	5	GND	Ground.
4	6	4	6	4	6	PFI	Power-fail input voltage monitor. With PFI less than 1.25V, $\overline{PFO}$ goes LOW. Connect PFI to Ground when not in use.
5	7	5	7	5	7	$\overline{PFO}$	Power-fail output. The output is active LOW and sinks current when PFI is less than 1.25V. If not used, leave the pin unconnected.
6	8	6	8	-	-	WDI	Watchdog input. WDI controls the internal watch-dog timer. A HIGH or LOW signal for 1.6sec at WDI allows the internal timer to run-out, setting $\overline{WDO}$ low. A rising or falling edge must occur at WDI within 1.6 seconds or $\overline{WDO}$ goes LOW. The watchdog function is disabled by floating WDI. The internal watchdog timer clears when: Reset is asserted; WDI is three-stated; or WDI sees a rising or falling edge.
-	-	-	-	6	8	NC	Not Connected
-	-	7	1	7	1	$\overline{RESET}$	Active LOW reset output. Pulses LOW for 200ms when triggered, and stays LOW whenever V_{CC} is below the reset threshold. $\overline{RESET}$ remains LOW for 200ms after V_{CC} rises above the reset threshold or $\overline{MR}$ goes from HIGH to LOW. A watchdog timeout will not trigger $\overline{RESET}$ unless $\overline{WDO}$ is connected to $\overline{MR}$.

rev 1.5

Pin Number						Name	Function
ASM706P		ASM706R/S/T/J		ASM708R/S/T/J			
DIP/ SO	MicroSO	DIP/ SO	MicroSO	DIP/ SO	MicroSO		
8	2	8	2	-	-	$\overline{WDO}$	Watchdog output. $\overline{WDO}$ goes LOW when the 1.6 second interval watchdog timer times-out and does not go HIGH until a transition occurs at WDI. In addition, when V_{CC} falls below the reset threshold, $\overline{WDO}$ goes LOW. Unlike RESET, $\overline{WDO}$ does not have a minimum pulse width and as soon as V_{CC} exceeds the reset threshold, $\overline{WDO}$ becomes HIGH with no delay.
7	1	-	-	8	2	RESET	Active HIGH reset output. The inverse of $\overline{RESET}$.

April 2005

rev 1.5

Detailed Descriptions

A proper reset input enables a microprocessor/ microcontroller to start in a known state. ASM706 P/ R/ S/ T/ J and ASM708 R/ S/ T/ J assert reset to prevent code execution errors during power-up, power-down and brown-out conditions.

RESET/$\overline{\text{RESET}}$ Operation

The RESET/$\overline{\text{RESET}}$ signals are designed to start or return a µP/µC to a known state.

With V_{CC} above 1.2V, RESET and $\overline{\text{RESET}}$ are guaranteed to be asserted. During a power-up sequence, the reset outputs remain asserted until the supply rises above the threshold level. The resets are deasserted approximately 200ms after crossing the threshold.

In a brownout situation where V_{CC} falls below the threshold level, the reset outputs are asserted. If a brownout occurs during an already initiated reset period, the reset period will extend for an additional reset period of 200ms.

The ASM708 devices have dual reset outputs, one active LOW and one active HIGH. The ASM706P has a single active HIGH reset and the ASM706/R/S/T/J devices have an active LOW reset output.

Alliance Part #	RESET Polarity	Threshold	Watchdog Timer
ASM706P	HIGH	2.63V	YES
ASM706R	LOW	2.63V	YES
ASM706S	LOW	2.93V	YES
ASM706T	LOW	3.08V	YES
ASM706J	LOW	4.00V	YES
ASM708R	HIGH & LOW	2.63V	NO
ASM708S	HIGH & LOW	2.93V	NO
ASM708T	HIGH & LOW	3.08V	NO
ASM708J	HIGH & LOW	4.00V	NO

Manual Reset ($\overline{\text{MR}}$)

The active-LOW manual reset input is pulled high by an internal 20kΩ pull-up resistor and can be driven low by CMOS/TTL logic or a mechanical switch to ground. An external debounce circuit is unnecessary since the 140ms minimum reset time will debounce mechanical push button switches. The minimum $\overline{\text{MR}}$ input pulse width is 0.5µs with a 3V V_{CC} input and 0.15µs with a 5V V_{CC} input. If not used, tie $\overline{\text{MR}}$ to V_{CC} or leave floating.
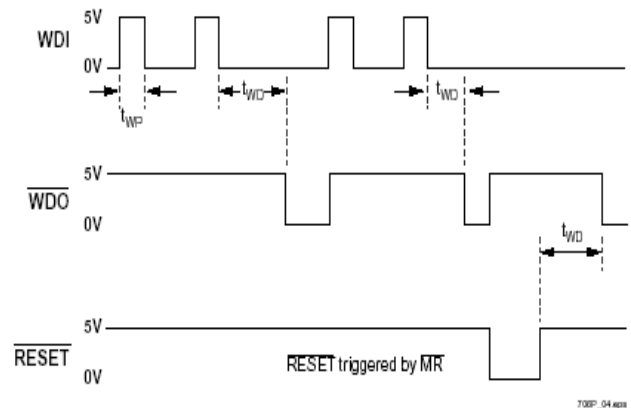

Figure 1: WDI Three-state operation

By connecting the watchdog output ($\overline{\text{WDO}}$) and $\overline{\text{MR}}$, a watchdog timeout forces a RESET to be generated.

Watchdog Timer

A watchdog timer available on the ASM706P/R/S/T/J monitors µP/µC activity. An output line on the processor is used to toggle the WDI line. If the line is not toggled within 1.6 seconds on the Watchdog Input (WDI), the internal timer puts the Watchdog Output ($\overline{\text{WDO}}$) into a LOW state. $\overline{\text{WDO}}$ will remain LOW until a toggle is detected at WDI.

The watchdog function is disabled, meaning it is cleared and not counting, if WDI is floated or connected to a three-stated circuit. The watchdog timer is also disabled if RESET is asserted. When RESET becomes inactive and the WDI input sees a high or low transition as short as 100ns (V_{CC} = 2.7V)/ 50ns (V_{CC} = 4.5V), the watchdog timer will begin a 1.6

3/3.3/4.0 V µP Supervisor Circuits

April 2005

rev 1.5

second countdown. Additional transitions at WDI will reset the watchdog timer and initiate a new countdown sequence. $\overline{WDO}$ will also become LOW and remain so, whenever the supply voltage, V_{CC}, falls below the device threshold level. $\overline{WDO}$ goes HIGH as soon as V_{CC} transitions above the threshold. There is no minimum pulse width for $\overline{WDO}$ as there is for the RESET outputs. If WDI is floated, $\overline{WDO}$ essentially acts as a low supply voltage output indicator.

Power-failure Detection With Auxiliary Comparator

All devices have an auxiliary comparator with 1.25V trip point. The output, $\overline{PFO}$, is active LOW and the noninverting input is PFI. This comparator can be used as a supply voltage monitor with an external resistor voltage divider. As the monitored voltage level falls, PFI is reduced causing the $\overline{PFO}$ output to go LOW. Normally $\overline{PFO}$ interrupts the processor so the system can be shut down in a controlled manner.

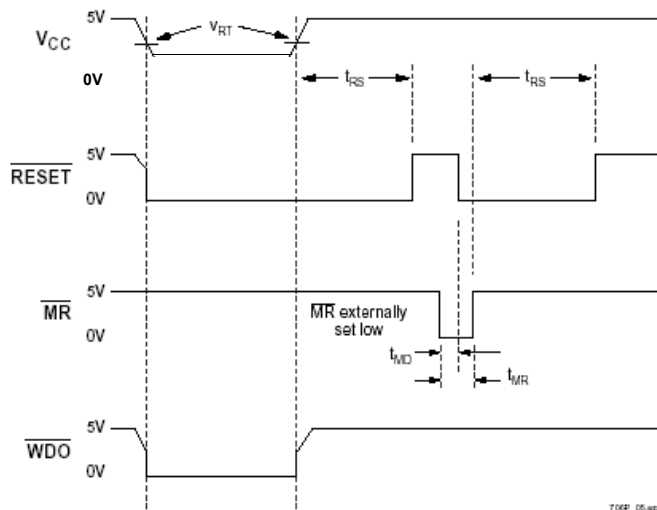

Figure 2: Watchdog timing

Application Information

Bi-directional Reset Pin Interfacing

The ASM706/8 can interface with µP/µC bi-directional reset pins by connecting a 4.7kΩ resistor in series with the RESET output and the µP/µC bi-directional reset pin.

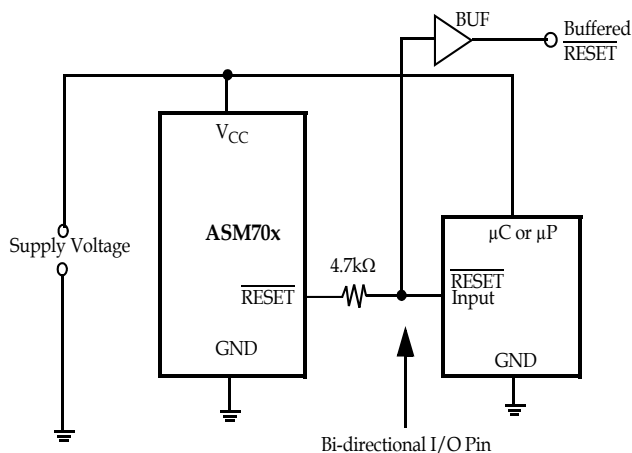

Figure 3: Bi-directional reset pin interfacing

Ensuring the $\overline{RESET}$ is Valid Down to V_{CC} = 0V

When V_{CC} falls below 1.2V, the ASM706R/S/T/J and 708R/S/T/J $\overline{RESET}$ outputs no longer pull down; it becomes indeterminate. To avoid the possibility that stray charges could build up and force $\overline{RESET}$ to the wrong state, a pull-down resistor should be connected to the $\overline{RESET}$ pin, thus draining such charges to ground. The resistor value is not critical. A100kΩ resistor will pull $\overline{RESET}$ to ground without loading it.

rev 1.5

Monitoring Voltages Other Than V_{CC}

Monitoring Voltages Other Than V_{CC}

The ASM706/708 can monitor voltages other than V_{CC} using the Power Fail circuitry. If a resistive divider is connected from the voltage to be monitored to the PFI input, the $\overline{PFO}$ will go LOW if the voltage at PFI goes below 1.25V reference. Should hysteresis be desired, connect a resistor (equal to approximately 10 times the sum of the two resistors in the divider) between the PFI and $\overline{PFO}$ pins. A capacitor between PFI and GND will reduce circuit sensitivity to input high frequency noise. If it is desired to assert a reset in addition to the $\overline{PFO}$ flag, this may be achieved by connecting the $\overline{PFO}$ output to $\overline{MR}$.
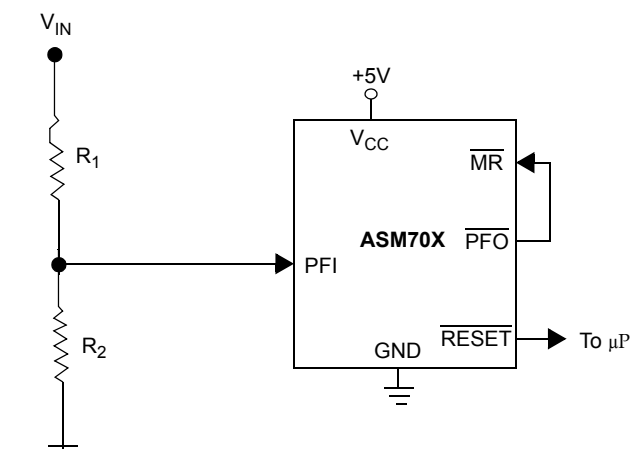

Figure 4: Monitoring +5V and an additional supply V_{IN}

Absolute Maximum Ratings

Parameter	Min	Max	Unit
Pin Terminal Voltage with Respect to Ground			
V_{CC}	-0.3	6.0	V
All other inputs	-0.3	V_{CC} + 0.3	V
Input Current at V_{CC} and GND		20	mA
Output Current: All outputs		20	mA
Rate of Rise at V_{CC}		100	V/µs
Plastic DIP Power Dissipation (Derate 9mW/°C above 70°C)		700	mW
SO Power Dissipation (Derate 5.9mW/°C above 70°C)		470	mW'
MicroSO Power Dissipation (Derate 4.1mW/°C above 70°C)		330	mW
Operating Temperature Range

Notes:
• For parts to be packed in Tape and Reel, add "-T" at the end of the part number.
• Alliance Semiconductor's lead free parts are RoHS compliant.
• All parts are Lead Free by default. Contact factory for Non Lead Free devices
