Description

The TS4962 is a differential class-D B.T.L. power amplifier. Able to drive up to 2.3W into a 4Ω load and 1.4W into a 8Ω load at 5V. It achieves outstanding efficiency (88%typ.) compared to classical AB-class audio amps.

Gain of the device can be controlled via two external gain setting resistors. POP & CLICK reduction circuitry provides low on/off switch noise while allowing the device to start within 5ms. A standby function (active low) allows to lower the current consumption to 10nA typ.

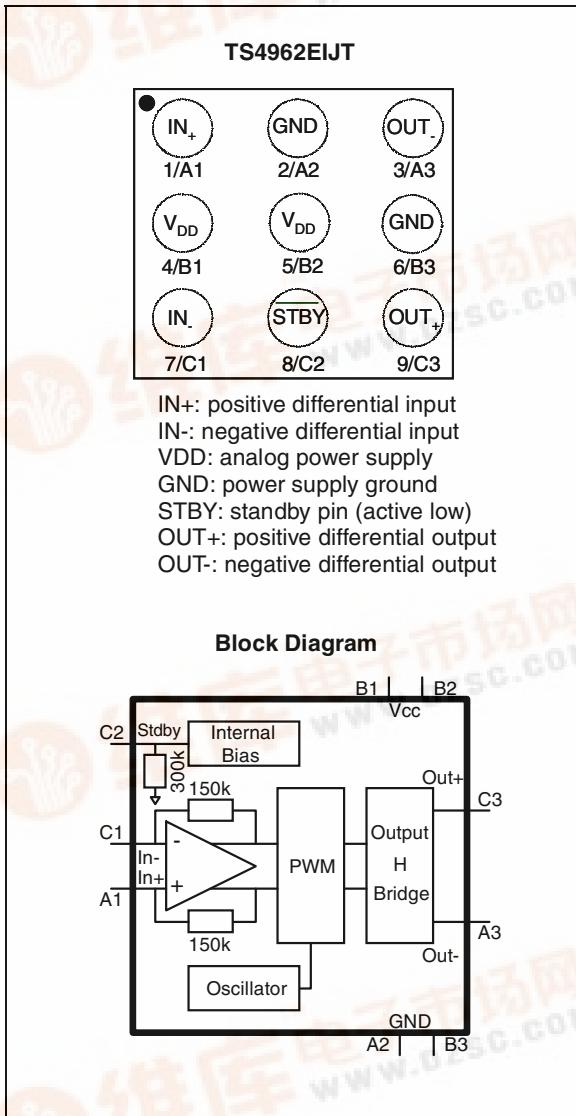

Applications

- Cellular Phone
- PDA
- Notebook PC

2 Application Component Information

Component	Functional Description
Cs	Bypass supply capacitor. To install as close as possible of the TS4962 to minimize high frequency ripple. A 100nF ceramic capacitor should be add to enhance the power supply filtering in high frequency.
Rin	Input resistor to program the TS4962 differential gain (Gain = $300\text{k}\Omega/\text{Rin}$ with Rin in $\text{k}\Omega$)
Input Capacitor	Thanks to common mode feedback, these input capacitors are optional. However, we can add then to form with Rin a 1st order high pass filter with -3dB cut-off frequency = $1/(2\pi\text{Rin}\text{Cin})$

1) Parameters guaranteed by evaluation and design, not by test.

2) Standby mode is activated when V_{stdby} is tied to GND.

Note: In the graphs that follow, the following abbreviations are used:

$RL + 15\mu H$ or $30\mu H$ = pure resistor+ very low series resistance inductor

Filter = LC output filter ($1\mu F + 30\mu H$ for 4Ω and $0.5\mu F + 60\mu H$ for 8Ω)

All measurements done with $Cs1=1\mu F$ and $Cs2=100nF$ except for PSRR where $Cs1$ is removed
