Notes:

- When measuring output ripple, it is recommended that an external 10.0 μF ceramic capacitor be placed from the +Vout pin to the -Vout pin. For noise sensitive applications, the use of 47 μF capacitors will reduce the output ripple.
- Transient recovery is measured to within a 1% error band for a load step change of 75% to 100%.
- The Remote On/Off Control input (Pin 3) is referenced to -Vin (Pin 1). Connection to the pin should be made through a 1k Ω resistor and diode (1N4148). If it is not used, the control pin should be left open.
- Operation at no-load will not damage these units. However, they may not meet all specifications.
- The +sense and -sense connections will compensate for up to 5% of Vout. When not used, they should be connected directly to the appropriate output pin (+sense to +Vout and -sense to -Vout).
- To improve performance and stability, a simple external LC filter can be added to the unit input. Typical component values would be 1.0 $\mu\text{H}/10\text{A}$ & 1,000 $\mu\text{F}/25\text{V}$ for 12V input models; 2.2 $\mu\text{H}/10\text{A}$ & 1,000 $\mu\text{F}/50\text{V}$ for 24V input models; and 74.7 $\mu\text{H}/5\text{A}$ & 1,000 $\mu\text{F}/100\text{V}$ for 48V input models.
- It is recommended that a fuse be used on the input of a power supply for protection. See the table above for the correct rating.

External Trim

A simple external circuit may be used to adjust the converter output. To adjust the output DOWN, connect a 5%, 3W resistor between the plus output pin and the Vout trim pin. To adjust the output UP, connect a 5%, 3W resistor between the minus output pin and the Vout trim pin. To calculate the correct resistor value (in k Ω) use:

$$3.3 V_{\text{OUT}} \text{ UP } R_{\text{ADJ}} = \frac{(V_{\text{OUT}} - 1.24) \times (2.87)}{V_{\text{ADJ}} - V_{\text{OUT}}} - 10$$

$$\text{Other } V_{\text{OUT}} \text{ UP } R_{\text{ADJ}} = \frac{(V_{\text{OUT}} - 2.5) \times (2.87)}{V_{\text{ADJ}} - V_{\text{OUT}}} - 10$$

$$3.3 V_{\text{OUT}} \text{ Down } R_{\text{ADJ}} = \frac{(V_{\text{ADJ}} - 1.24) (V_{\text{OUT}} - 1.24) \times 2.87}{V_{\text{OUT}} - V_{\text{ADJ}}} - 10$$

$$\text{Other } V_{\text{OUT}} \text{ Down } R_{\text{ADJ}} = \frac{(V_{\text{ADJ}} - 2.5) (V_{\text{OUT}} - 2.5) \times 2.87}{V_{\text{OUT}} - V_{\text{ADJ}}} - 10$$

For UP/Down trimming capability, connect a 10 kW potentiometer between the plus and minus outputs with the wiper arm connected to the Vout trim pin.
