

Micropower Op Amp, Comparator and Reference

FEATURES

- Quiescent Current: 5 μ A Typ
- Outputs Swing Rail-to-Rail
- Low Op Amp Offset Voltage: 700 μ V Max
- Reference Output Drives 0.01 μ F Capacitor
- Internal 1.2V \pm 0.4% Reference Output (LTC1541)
- Low Input Bias Current: 1nA Max
- Reference Output Can Source Up to 2mA
- Internal \pm 3mV Comparator Hysteresis
- Comparator and Op Amp Input Range Includes Ground
- Op Amp Capable of Driving Up to 1000pF Load
- Unity-Gain Stable and 12kHz Bandwidth
- 2.5V to 12.6V Supply Voltage Range
- Pin Compatible Upgrade for MAX951/MAX953

APPLICATIONS

- Battery- or Solar-Powered Systems
- Automotive Keyless Entry
- Low Frequency, Local Area Alarms/Detectors
- Infrared Receivers for Remote Controls
- Smoke Detectors and Safety Sensors
- GSM Portable Phones

DESCRIPTION

The LTC[®]1541/LTC1542 combine a micropower amplifier, comparator and bandgap reference (LTC1541) in an 8-pin package. The part operates from a single 2.5V to 12.6V or dual \pm 1.25V to \pm 6.3V supply with a typical supply current of 5 μ A. Both the op amp and comparator feature a common mode input voltage range that extends from the negative supply to within 1.3V of the positive supply. The op amp output stage swings from rail-to-rail. The comparator's inverting input is internally connected to the reference output (LTC1541).

The reference output voltage is 1.2V \pm 1% over the extended temperature range. The output can drive a bypass capacitor of up to 0.01 μ F without any oscillations. It can also source up to 2mA and sink up to 20 μ A.

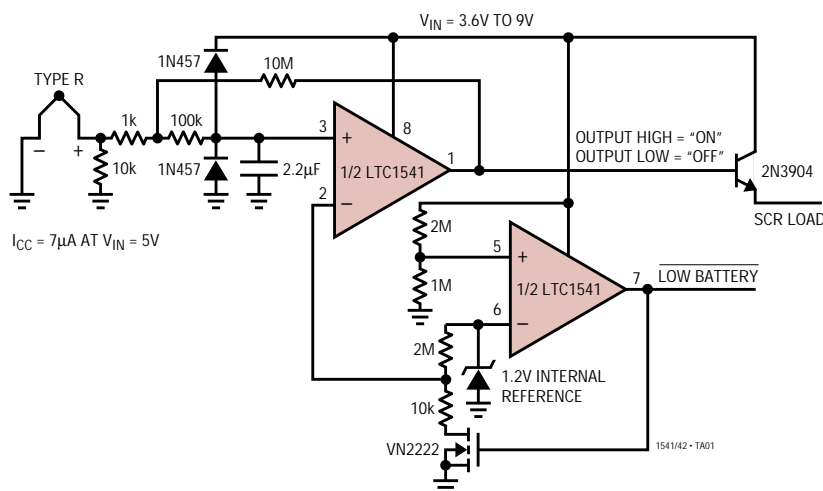

The op amp is internally compensated to be unity-gain stable with typical GBW at 12kHz and slew rate of 8V/ms. The comparator has \pm 3mV of internal hysteresis to ensure clean output switching, even with slow moving input signals.

The LTC1541/LTC1542 are available in MSOP and SO-8 packages.

 LTC and LT are registered trademarks of Linear Technology Corporation.

TYPICAL APPLICATION

The ● denotes specifications which apply over the full operating temperature range.

Note 1: Supply current is tested with $COMPIN^+ = (REF - 100mV)$ for LTC1541 and $COMPIN^+ = 0V$, $COMPIN^- = 100mV$ for LTC1542.

Note 2: Input offset voltage is defined as the center of the input referred hysteresis, $V_{CM} = REF$ (LTC1541). $V_{CM} = 1/2 V_{CC}$ (LTC1542).

Note 3: Trip point is defined as the differential input voltage required to make the comparator output change state. The difference between upper and lower trip point is equal to the width of the input referred hysteresis, $V_{CM} = REF$ (LTC1541). $V_{CM} = 1/2 V_{CC}$ (LTC1542).

Note 4: The input leakage current is measured for $COMPIN^+$ at 1.5V (LTC1541) and $COMPIN^+ = COMPIN^- = 1.5V$ (LTC1542).

PIN FUNCTIONS

AMPOUT (Pin 1): Op Amp Output. The output can swing from rail-to-rail while driving a capacitive load of up to 1000pF. The output can source and sink 0.7mA (min).

AMPIN⁻ (Pin 2): Inverting Input of Op Amp. The input common mode ranges from V_{SS} to $(V_{CC} - 1.3V)$. The input current is typically 10pA at 25°C.

AMPIN⁺ (Pin 3): Noninverting Input of Op Amp. The input common mode ranges from V_{SS} to $(V_{CC} - 1.3V)$. The input current is typically 10pA at 25°C.

V_{SS} (Pin 4): Negative Supply or Ground Connection.

COMPIN⁺ (Pin 5): Noninverting Input of Comparator. The input common mode ranges from V_{SS} to $(V_{CC} - 1.3V)$. The input current is typically 10pA at 25°C.

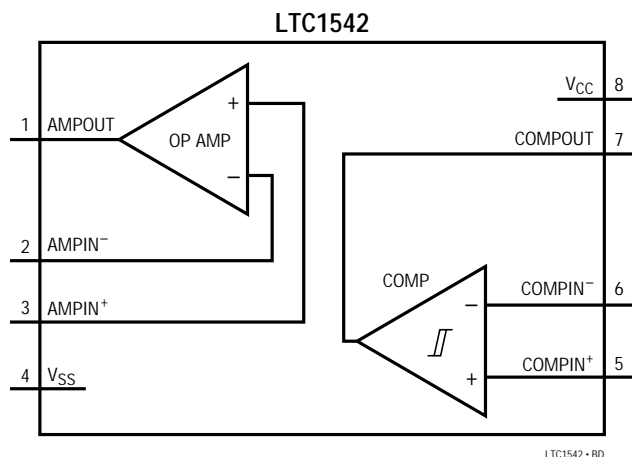

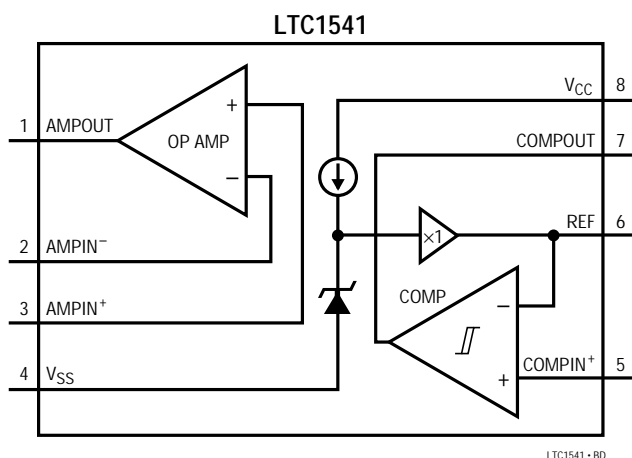

REF (Pin 6) (LTC1541): Reference Output. $V_{REF} = 1.2V \pm 1\%$ over industrial temperature range, and is also connected to inverting comparator input internally. This device can source up to 2mA and sink up to 20μA. The output can drive a bypass capacitor of up to 0.01μF without oscillation.

COMPIN⁻ (Pin 6) (LTC1542): Inverting Input of Comparator. The input common mode ranges from V_{SS} to $(V_{CC} - 1.3V)$. The input current is typically 10pA at 25°C.

COMPOUT (Pin 7): Comparator Output. The output can source 20mA and sink 5mA.

V_{CC} (Pin 8): Positive Supply, $2.5V \leq V_{CC} \leq 12.6V$. The supply bypass capacitors are not required if the supply impedance is low. For single supply applications, it is a good general practice to bypass V_{CC} with a 0.1μF capacitor to ground.

BLOCK DIAGRAMS

APPLICATIONS INFORMATION

The LTC1541/LTC1542 are a combination of a micropower op amp, comparator and $1.2\text{V} \pm 1\%$ reference (LTC1541) in an 8-pin package. The LTC1541 has the negative input of the comparator internally connected to the reference output. The supply voltage range is from 2.5V to 12.6V for single supply and $\pm 1.25\text{V}$ to $\pm 6.3\text{V}$ for dual supplies. The supply current is a mere $5\mu\text{A}$ (typical) with a 5V single supply.

Op Amp

The op amp is internally compensated to be unity-gain stable, with typical GBW at 12kHz and slew rate of 8V/ms. The output can drive a capacitive load of up to 1000pF and swings from rail-to-rail. The input range is from the negative rail to within 1.3V of the positive rail. The input bias current is less than 1nA maximum at the extended temperature range.

Figure 1. Damping the Reference Output

Comparator

The comparator has a high impedance differential input stage with a common mode input range from the negative rail to within 1.3V of the positive rail. The CMOS output stage can swing from rail-to-rail and source up to 20mA continuously. The output stage has been designed to eliminate the power supply glitches that normally occur when the output changes logic state. In addition, internal hysteresis ($\pm 3\text{mV}$) ensures clean output switching even with slow moving input signals. The negative input is internally connected to the reference for the LTC1541.

Reference

The internal bandgap reference has an output voltage of $1.2\text{V} \pm 1\%$ over the industrial grade temperature range.

The output can source up to 2mA and sink up to $20\mu\text{A}$ with a 5V supply. The output can drive a bypass capacitor of up to $0.01\mu\text{F}$ without oscillation and by inserting a series resistor, capacitance values up to $100\mu\text{F}$ can be used (Figure 1). Figure 2 shows the resistor value required for different capacitor values to achieve critical damping. Bypassing the reference can help prevent false tripping of the comparator by preventing glitches on V_{CC} or reference load transients from disturbing the reference output voltage. Figures 3a and 3b show the bypass reference output with a square wave applied to the V_{CC} pin while resistor R1 damps the reference response. Note that the comparator output doesn't trip.

Op Amp Stability

Unlike other industry standard micropower CMOS op amps, the op amp in the LTC1541/LTC1542 maintain stability in unity-gain configuration while driving heavy capacitive loads of up to 1000pF.

Although this family is primarily designed for low frequency applications, good layout is extremely important. Low power, high impedance circuits may increase the effects of board leakage and stray capacitance. For example, the combination of a 10M resistance (from leakage between traces on a contaminated, poorly designed PC board) and a 1pF stray capacitance provides a pole at approximately 16kHz, which is near the amplifier's bandwidth. Board routing and layout should minimize leakage and stray capacitance. In some cases, stray capacitance may be unavoidable and it may be necessary to add a small capacitor across the feedback resistor to compensate (Figure 4); select the smallest capacitor value that ensures stability.

Inputs

The input common mode range for both the op amp and comparator is from the negative supply to within 1.3V of the positive supply. The inputs can be taken more than 300mV below the negative supply without damaging the device if the current out of the pin is limited to less than 1mA. Unlike bipolar input op amps and comparators, the outputs of the CMOS LTC1541/LTC1542 will not reverse phase when the inputs are taken above the common mode input range.

TYPICAL APPLICATIONS

The schematic diagram illustrates the LTC1541 circuit, which is a precision, low-power, single-supply operational amplifier. The circuit is powered by a Li-Ion battery and includes a 4.2V float load. The input section features a 6V source (V_{IN}) and a 300mA current source. The shutdown input is connected to a 1M resistor ($R1$). The feedback network consists of a 220Ω resistor ($R2$), a 3.83k resistor ($R3$), a 100k resistor ($R4$), a 2.2M resistor ($R5$), a 33k resistor ($R6$), a 0.15Ω resistor ($R7$), a 249k resistor ($R8$), and a 100k resistor ($R9$). The LTC1541 IC is configured with a feedback loop containing a diode ($D1$, 1N5817) and a capacitor ($C1$, 4700pF). The output is connected to a 4.2V float load through a 300mA current source. The circuit is powered by a Li-Ion battery.
