- Utilizes digital inputs and outputs to transmit and receive USB cable data
- Supports 12Mbit/s “Full Speed” and 1.5Mbit/s “Low Speed” serial data transmission
- Compatible with the VHDL “Serial Interface Engine” from USB developer’s conference
- Available in SO, 14 pin package
- Hysteresis on D+, D–, V_{MO} inputs

DESCRIPTION

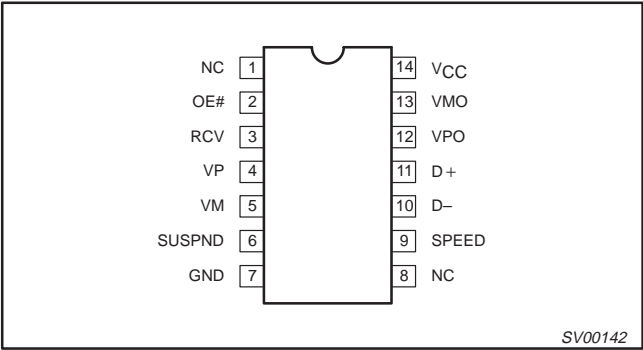

The PDIUSBP11 is a one chip generic USB transceiver. It is designed to allow 5.0V or 3.3V programmable and standard logic to interface with the physical layer of the Universal Serial Bus. It is capable of transmitting and receiving serial data at both full speed (12Mbit/s) and low speed (1.5Mbit/s) data rates. The outputs from the serial interface engine (inputs VPO and VMO on the PDIUSBP11) are driven by the host. The gated inputs (outputs VP and VM on the PDIUSBP11) are to be decoded by the host.

Implementation of the Serial Interface Engine along with the USB transceiver allow the designer to make flexible USB compatible devices with widely available logic components.

NOTES:

1. Stresses beyond those listed may cause permanent damage to the device. These are stress ratings only and functional operation of the device at these or any other conditions beyond those indicated under "recommended operating conditions" is not implied. Exposure to absolute-maximum-rated conditions for extended periods may affect device reliability.
2. The performance capability of a high-performance integrated circuit in conjunction with its thermal environment can create junction temperatures which are detrimental to reliability. The maximum junction temperature of this integrated circuit should not exceed 150°C.
3. The input and output voltage ratings may be exceeded if the input and output clamp current ratings are observed.
