

# High-Linearity 1700MHz to 2200MHz Down-Conversion Mixer with LO Buffer/Switch

## General Description

The MAX9993 high-linearity down-conversion mixer provides 8.5dB of gain, +23.5dBm IIP3, and 9.5dB NF for UMTS, DCS, and PCS base-station applications.

The MAX9993 integrates baluns in the RF and LO ports, a dual-input LO selectable switch, an LO buffer, a double-balanced mixer, and a differential IF output amplifier. The MAX9993 requires a typical LO drive of +3dBm, and supply current is guaranteed to below 230mA.

The MAX9993 is available in a compact 20-pin thin QFN package (5mm x 5mm) with an exposed pad. Electrical performance is guaranteed over the extended -40°C to +85°C temperature range.

The MAX9993 EV kit is available; contact the factory for more information.

## Features

- ◆ +23.5dBm Input IIP3
- ◆ 1700MHz to 2200MHz RF Frequency Range
- ◆ 40MHz to 350MHz IF Frequency Range
- ◆ 1400MHz to 2000MHz LO Frequency Range
- ◆ 8.5dB Conversion Gain
- ◆ 9.5dB Noise Figure
- ◆ Integrated LO Buffer
- ◆ Switch-Selectable (SPDT), Two LO Inputs
- ◆ Low 0 to +6dBm LO Drive
- ◆ 40dB LO1-to-LO2 Isolation

## Applications

UMTS and 3G Base Stations  
DCS1800 and EDGE Base Stations  
PCS1900 Base Stations  
Point-to-Point Microwave Systems  
Wireless Local Loop  
Private Mobile Radio  
Military Systems

Conversion Loss, LO to IF		P <sub>LO</sub> = +0dBm, inject -20dBm at 200MHz into LO port, measure 200MHz at IF		28			dB
LO Switching Time		50% of LOSEL to IF settled to within 2 degrees		<50			ns
LO1-to-LO2 Isolation		(Note 4)		40			dB
RF Return Loss				19			dB
LO Return Loss		LO port selected		15			dB
		LO port unselected		14			
IF Return Loss		RF terminated, P <sub>LO</sub> = +3dBm (Note 5)		15			dB

**Note 1:** Guaranteed by design and characterization.

**Note 2:** All limits reflect losses of external components. Output measurements taken at IFOUT of the *Typical Application Circuit*.

**Note 3:** Production tested.

**Note 4:** Measured at IF port at IF frequency.  $f_{LO1}$  and  $f_{LO2}$  are offset by  $1MHz$ ,  $P_{LO1} = P_{LO2} = +3dBm$ .

**Note 5:** IF return loss can be optimized by external matching components.

**Note 6:** Operation outside this range is possible, but with degraded performance of some specifications.

## Pin Description

PIN	NAME	FUNCTION
1, 6, 8	VCC	Power Supply Connections. See the <i>Typical Application Circuit</i> .
2	RF	Single-Ended 50 $\Omega$ RF Input. This port is internally matched and DC shorted to GND through a balun. Provide a DC-blocking capacitor if required.
3	TAP	Center Tap of the Internal RF Balun. Bypass with capacitors close to the IC, as shown in the <i>Typical Application Circuit</i> .
4, 5, 10, 12, 13, 14, 17, EP	GND	Ground. Connect to supply ground. Provide multiple vias in the PC board to create a low-inductance connection between the exposed paddle (EP) and the PC board ground.
7	LOBIAS	LO Output Bias Resistor for LO Buffer. Connect a 383 $\Omega$ ( $\pm 1\%$ ) from LOBIAS to GND.
9	LOSEL	LO Select. Logic control input for selecting LO1 or LO2.
11	LO1	Local Oscillator Input. LO1 selected when LOSEL is low.
15	LO2	Local Oscillator Input. LO2 selected when LOSEL is high.
16	LEXT	External Inductor Connection. Connect a low-ESR 10nH inductor from LEXT to GND. This inductor carries approximately 100mA DC current.
18	IF-	Noninverting IF Output. Requires external bias to VCC through an RF choke (see the <i>Typical Application Circuit</i> ).
19	IF+	Inverting IF Output. Requires external bias to VCC through an RF choke (see the <i>Typical Application Circuit</i> ).
20	IFBIAS	IF Bias Resistor Connection for IF Amplifier. Connect a 523 $\Omega$ ( $\pm 1\%$ ) from IFBIAS to GND.

## Detailed Description

The MAX9993 high-linearity down-conversion mixer provides 8.5dB of gain and +23.5dBm IIP3, with a 9.5dB noise figure (typ). Integrated baluns and matching circuitry allow 50 $\Omega$  single-ended interfaces to the RF and LO ports. A single-pole, double-throw (SPDT) LO switch provides 50ns switching time between LO inputs, with typically 40dB LO-to-LO isolation. Furthermore, the integrated LO buffer provides a high drive level to the mixer core, reducing the LO drive required at the MAX9993's inputs to 0dBm to +6dBm range. The IF port incorporates a differential output, which is ideal for providing enhanced IIP2 performance.

Specifications are guaranteed over broad frequency ranges to allow for use in UMTS and 2G/2.5G/3G DCS1800 and PCS1900 base stations. The MAX9993 is specified to operate over an RF input range of 1700MHz to 2200MHz, an LO range of 1400MHz to 2000MHz, and an IF range of 40MHz to 350MHz. This device can operate in high-side LO injection applications with an extended LO range, but performance degrades gently as  $f_{LO}$  continues to increase. See the *Typical Operating Characteristics* for measurements taken with  $f_{LO}$  up to 2400MHz. This device is available in a compact 5mm  $\times$  5mm 20-pin thin QFN package with an exposed pad.

## RF Input and Balun

The MAX9993 has one input (RF) that is internally matched to 50 $\Omega$ , requiring no external matching components. A DC-blocking capacitor is required, because the input is internally DC shorted to ground through the on-chip balun. Input return loss is better than 15dB over the entire RF frequency range of 1700MHz to 2200MHz.

## LO Input, Switch, Buffer, and Balun

The mixer can be used for either high-side or low-side injection applications with an LO frequency range of 1400MHz to 2000MHz. An internal LO SPDT switch selects one of two single-ended LO ports. This allows the external oscillator to settle on a particular frequency before it is switched in. LO switching time is guaranteed to be less than 50ns. This switch is controlled by a digital input (LOSEL): logic low selects LO1, logic high selects LO2. LO1 and LO2 inputs are internally matched to 50 $\Omega$ , requiring only a 22pF DC-blocking capacitor.

A two-stage internal LO buffer allows a wide input power range for the LO drive. All guaranteed specifications are for an LO signal power from 0dBm to +6dBm. A low-loss balun along with an LO buffer drives the double-balanced mixer. All interfacing and matching from the LO inputs to the IF outputs are integrated on-chip.

# High-Linearity 1700MHz to 2200MHz Down-Conversion Mixer with LO Buffer/Switch

**Table 1. Component List**

COMPONENT	VALUE	SIZE	DESCRIPTION
C1	4pF	0603	Microwave capacitor
C2, C6, C7, C9, C10	22pF	0603	Microwave capacitors
C3, C5, C8	0.01μF	0603	Capacitors
C4	10pF	0603	Microwave capacitor

L1, L2	470nH	1008	Wire-wound high-Q inductors
L3	10nH	0805	Wire-wound high-Q inductor
R1	523Ω	0603	±1% resistor
R2	383Ω	0603	±1% resistor
R3, R4	7.2Ω	1206	±1% resistors
R5	200Ω	0603	±5% resistor
T1	4:1 (200:50)	—	IF balun

## High-Linearity Mixer

The core of the MAX9993 is a double-balanced, high-performance passive mixer. Exceptional linearity is provided by the large LO swing from the on-chip LO buffer; IIP3 is typically +23.5dBm, IIP2 is typically +60dBm, and total cascaded NF is 9.5dB.

## Differential IF Output Amplifier

The MAX9993 mixer has an IF frequency range of 40MHz to 350MHz. The differential, open-collector IF output ports require external pullup inductors to VCC. Single-ended IF applications require a 4:1 balun to transform the 200Ω differential output impedance to a 50Ω single-ended output. After the balun, VSWR is typically 1.5:1.

## Applications Information

### Input and Output Matching

The RF and LO inputs are internally matched to 50Ω. No matching components are required. Return loss at the RF port is better than 15dB over the entire input range, 1700MHz to 2200MHz, and return loss at LO1 and LO2 is better than 10dB from 1400MHz to 2000MHz. RF and LO inputs require only DC-blocking capacitors for interfacing. These DC-blocking capacitors can be part of the matching circuit.

The IF output impedance is 200Ω differential out of the IC. An external low-loss 4:1 balun brings this impedance down to a 50Ω single-ended output (see the *Typical Application Circuit*).

## Bias Resistors

Bias currents for the LO buffer and the IF amplifier were optimized by fine-tuning the resistors at LOBIAS and IFBIAS during characterization at the factory. These currents should not be adjusted. If the 383Ω (±1%) and/or 523Ω (±1%) resistor values are not readily available, substitute standard ±5% values: 390Ω and 520Ω, respectively.

## Layout Considerations

A properly designed PC board is an essential part of any RF/microwave circuit. Keep RF signal lines as short as possible to reduce losses, radiation, and inductance. For best performance, route the ground pin traces directly to the exposed pad underneath the package. This pad should be connected to the ground plane of the board by using multiple vias under the device to provide the best RF/thermal conduction path. Solder the exposed pad on the bottom of the device package to a PC board exposed pad.

## Power Supply Bypassing

Proper voltage supply bypassing is essential for high-frequency circuit stability. Bypass each VCC pin and TAP with the capacitors shown in the typical application circuit. Place the TAP bypass capacitor to ground within 100 mils of the TAP pin.
