# Micropower, Ultrasensitive Hall-Effect Switches 

## Features and Benefits

- Micropower operation
- Operation with north or south pole
- 2.5 to 3.5 V battery operation
- Chopper stabilized
- Superior temperature stability
- Extremely low switchpoint drift
- Insensitive to physical stress
- High ESD protection
- Solid-state reliability
- Small size
- Easily manufacturable with magnet pole independence

## Packages:

## Description

The A 3211 and A3212 integrated circuits are ultrasensitive, pole independent Hall-effect switches with latched digital output. These sensors are especially suited for operation in battery-operated, hand-held equipment such as cellular and cordless telephones, pagers, and palmtop computers. A 2.5 to 3.5 V operation and a unique clocking scheme reduce the average operating power requirements to less than $15 \mu \mathrm{~W}$ with a 2.75 V supply.

Unlike other Hall-effect switches, either a north or south pole of sufficient strength will turn the output on in the A3212, and in the absence of a magnetic field, the output is off. The A3211 provides an inverted output. The polarity independence and minimal power requirements allow these devices to easily replace reed switches for superior reliability and ease of manufacturing, while eliminating the requirement for signal conditioning.

Improved stability is made possible through chopper stabilization (dynamic offset cancellation), which reduces the residual offset voltage normally caused by device overmolding, temperature dependencies, and thermal stress.

## Micropower, Ultrasensitive Hall-Effect Switches

## Description (continued)

This device includes on a single silicon chip a Hall-voltage generator, small-signal amplifier, chopper stabilization, a latch, and a MOSFET output. Advanced CMOS processing is used to take advantage of low-voltage and low-power requirements, component matching, very low input-offset errors, and small component geometries.

Four package styles provide magnetically optimized solutions for most applications. Miniature low-profile surface-mount package types $E H$ and $E L$ ( 0.75 and 0.50 mm nominal height) are leadless, LH is a 3-pin low-profile SMD, and UA is a three-pin SIP for through-hole mounting. Packages are lead $(\mathrm{Pb})$ free (suffix, $-T$ ) with $100 \%$ matte tin plated leadframes.

## Selection Guide

| Part Number | Packing* | Package | Ambient Temperature $\mathrm{T}_{\mathrm{A}}\left({ }^{\circ} \mathrm{C}\right)$ | State in Magnetic Field |
| :---: | :---: | :---: | :---: | :---: |
| A3211EEHLT-T | 3000 pieces per reel | $2 \mathrm{~mm} \times 3 \mathrm{~mm}, 0.75 \mathrm{~mm}$ nominal height MLP/DFN | -40 to 85 | Off |
| A3211EELLT-T | 3000 pieces per reel | $2 \mathrm{~mm} \times 2 \mathrm{~mm}, 0.50 \mathrm{~mm}$ nominal height MLP/DFN |  |  |
| A3211ELHLT-T | 3000 pieces per reel | 3-pin surface mount SOT23W |  |  |
| A3211EUA-T | 500 pieces per bulk bag | SIP-3 through hole |  |  |
| A3212EEHLT-T | 3000 pieces per reel | $2 \mathrm{~mm} \times 3 \mathrm{~mm}, 0.75 \mathrm{~mm}$ nominal height MLP/DFN | -40 to 85 | On |
| A3212EELLT-T | 3000 pieces per reel | $2 \mathrm{~mm} \times 2 \mathrm{~mm}, 0.50 \mathrm{~mm}$ nominal height MLP/DFN |  |  |
| A3212ELHLT-T | 3000 pieces per reel | 3-pin surface mount SOT23W |  |  |
| A3212EUA-T | 500 pieces per bulk bag | SIP-3 through hole |  |  |
| A3212LLHLT-T | 3000 pieces per reel | 3-pin surface mount SOT23W | -40 to 150 |  |
| A3212LUA-T | 500 pieces per bulk bag | SIP-3 through hole |  |  |

## Absolute Maximum Ratings

| Characteristic | Symbol | Notes | Rating | Units |
| :--- | :---: | :--- | :---: | :---: |
| Supply Voltage | $\mathrm{V}_{\mathrm{DD}}$ |  | 5 | V |
| Magnetic Flux Density | B |  | Unlimited | G |
| Output Off Voltage | $\mathrm{V}_{\text {OUT }}$ |  | 5 | V |
| Output Current | $\mathrm{I}_{\text {OUT }}$ |  | 1 | mA |
| Operating Ambient Temperature | $\mathrm{T}_{\mathrm{A}}$ | Range E | -40 to 85 | ${ }^{\circ} \mathrm{C}$ |
|  |  | -40 to 150 | ${ }^{\circ} \mathrm{C}$ |  |
| Maximum Junction Temperature | $\mathrm{T}_{\mathrm{J}}(\max )$ |  | 165 | ${ }^{\circ} \mathrm{C}$ |
| Storage Temperature | $\mathrm{T}_{\text {stg }}$ |  | -65 to 170 | ${ }^{\circ} \mathrm{C}$ |

Package Suffix 'EH' Pinning (Leadless Chip Carrier)

Package Suffix 'LH' Pinning (SOT23W)

Package Suffix 'EL' Pinning (Leadless Chip Carrier)

Package Suffix 'UA' Pinning (SIP)

Pinning is shown viewed from branded side.

TYPICAL OPERATING CHARACTERISTICS

SWITCH POINTS

## SUPPLY CURRENT

## FUNCTIONAL DESCRIPTION

Low Average Power. Internal timing circuitry activates the sensor for $45 \mu \mathrm{~s}$ and deactivates it for the remainder of the period ( 45 ms ). A short "awake" time allows for stabilization prior to the sensor sampling and data latching on the falling edge of the timing pulse. The output during the "sleep" time is latched in the last sampled state. The supply current is not affected by the output state.

Chopper-Stabilized Technique. The Hall element can be considered as a resistor array similar to a Wheatstone bridge. A large portion of the offset is a result of the mismatching of these resistors. These devices use a proprietary dynamic offset cancellation technique, with an internal high-frequency clock to reduce the residual offset voltage of the Hall element that is normally caused by device overmolding, temperature dependencies, and thermal stress. The chopper-stabilizing technique cancels the mismatching of the resistor circuit by changing the direction of the current flowing through the Hall plate using CMOS switches and Hall voltage measurement taps, while maintaing the Hallvoltage signal that is induced by the external magnetic flux. The signal is then captured by a sample-and-hold circuit and further processed using low-offset bipolar circuitry. This technique produces devices that have an extremely stable quiescent Hall output voltage, are immune to thermal stress, and have precise recoverability after temperature cycling. A relatively high sampling frequency is used for faster signal processing capability can be processed.

More detailed descriptions of the circuit operation can be found in: Technical Paper STP 97-10, Monolithic Magnetic Hall Sensor Using Dynamic Quadrature Offset Cancellation and Technical Paper STP 99-1, Chopper-Stabilized Amplifiers With A Track-and-Hold Signal Demodulator.

Dwg. AH-011-2

## FUNCTIONAL DESCRIPTION (cont'd)

Operation. The output of the A3212 switches low (turns on) when a magnetic field perpendicular to the Hall sensor exceeds the operate point $\mathrm{B}_{\mathrm{OPS}}$ (or is less than $\mathrm{B}_{\mathrm{OPN}}$ ). After turn-on, the output is capable of sinking up to 1 mA and the output voltage is $\mathrm{V}_{\text {OUT(ON) }}$. When the magnetic field is reduced below the release point $\mathrm{B}_{\text {RPS }}$ (or increased above $\mathrm{B}_{\text {RPN }}$ ), the device output switches high (turns off). The difference in the magnetic operate and release points is the hysteresis ( $\mathrm{B}_{\mathrm{hys}}$ ) of the device. This built-in hysteresis allows clean switching of the output even in the presence of external mechanical vibration and electrical noise. The A3211 functions in the same manner, except the output voltage is reversed from the A3212, as shown in the figures to the right.
As used here, negative flux densities are defined as less than zero (algebraic convention), i.e., -50 G is less than +10 G .
Applications. Allegro's pole-independent sensing technique allows for operation with either a north pole or south pole magnet orientation, enhancing the manufacturability of the device. The state-of-the-art technology provides the same output polarity for either pole face.

It is strongly recommended that an external bypass capacitor be connected (in close proximity to the Hall sensor) between the supply and ground of the device to reduce both external noise and noise generated by the chopper-stabilization technique. This is especially true due to the relatively high impedance of battery supplies.

The simplest form of magnet that will operate these devices is a bar magnet with either pole near the branded surface of the device. Many other methods of operation are possible. Extensive applications information for Hall-effect sensors is available in:

- Hall-Effect IC Applications Guide, Application Note 27701;
- Hall-Effect Devices: Soldering, Gluing, Potting, Encapsulating, and Lead Forming, Application Note 27703.1;
- Soldering of Through-Hole Hall-Sensor Dervices, Application

Note 27703; and

- Soldering of Surface-Mount Hall-Sensor Devices, Application Note 27703.2.
