FEELING TECHNOLOGY

FM8P59

EPROM/ROM-Based 8-Bit Microcontroller

Devices Included in this Data Sheet:

- FM8P59AE : 28-pin EPROM device
- FM8P59BE : 32-pin EPROM device
- FM8P59A : 28-pin Mask ROM device
- FM8P59B : 32-pin Mask ROM device

FEATURES

- Only 47 single word instructions
- · All instructions are single cycle except for program branches which are two-cycle
- 13-bit wide instructions
- All ROM/EPROM area GOTO/FGOTO instruction
- All ROM/EPROM area subroutine CALL/FCALL instruction
- · 8-bit wide data path
- 5-level deep hardware stack
- 4K x 13 bits on chip EPROM/ROM
- 144 x 8 bits on chip general purpose registers (SRAM)
- Operating speed: DC-20 MHz clock input

DC-100 ns instruction cycle

- · Direct, indirect addressing modes for data accessing
- · 8-bit real time clock/counter (Timer0) with 8-bit programmable prescaler
- Internal Power-on Reset (POR)
- Built-in Low Voltage Detector (LVD) for Brown-out Reset (BOR)
- Power-up Reset Timer (PWRT) and Oscillator Start-up Timer(OST)
- On chip Watchdog Timer (WDT) with internal oscillator for reliable operation and soft-ware watch-dog enable/disable control
- Three I/O ports IOA, IOB and IOC with independent direction control
- · 16 soft-ware control pull-high pins: Port B/Port C
- 8 soft-ware control pull-down pins:IOA0~A3/IOB0~B3
- · 2 soft-ware control open-drain pins: IOC6/IOC7
- · One internal interrupt source: Timer0 overflow; Two external interrupt source: INT0 pin, INT1 pin
- Wake-up from SLEEP by Port B/IOC4/IOC5 input falling
- Power saving SLEEP mode
- Programmable Code Protection
- Selectable oscillator options:
 - ERC: External Resistor/Capacitor Oscillator
 - XT: Crystal/Resonator Oscillator
 - HF: High Frequency Crystal/Resonator Oscillator
 - LF: Low Frequency Crystal Oscillator
- Wide-operating voltage range:
- EPROM : 2.3V to 5.5V
- ROM : 2.3V to 5.5V

This datasheet contains new product information. Feeling Technology reserves the rights to modify the product specification without notice. No liability is assumed as a result of the use of this product. No rights under any patent accompany the sales of the product.

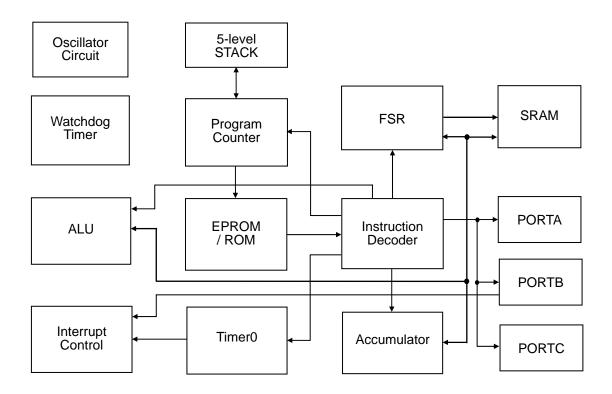

GENERAL DESCRIPTION

The FM8P59 series is a family of low-cost, high speed, high noise immunity, EPROM/ROM-based 8-bit CMOS microcontrollers. It employs a RISC architecture with only 47 instructions. All instructions are single cycle except for program branches which take two cycles. The easy to use and easy to remember instruction set reduces development time significantly.

The FM8P59 series consists of Power-on Reset (POR), Brown-out Reset (BOR), Power-up Reset Timer (PWRT), Oscillator Start-up Timer(OST), Watchdog Timer, EPROM/ROM, SRAM, tri-state I/O port, I/O pull-high/open-drain/pull-down control, Power saving SLEEP mode, real time programmable clock/counter, Interrupt, Wake-up from SLEEP mode, and Code Protection for EPROM products. There are four oscillator configurations to choose from, including the power-saving LP (Low Power) oscillator and cost saving RC oscillator. The FM8P59 series address 4K×13 of program memory.

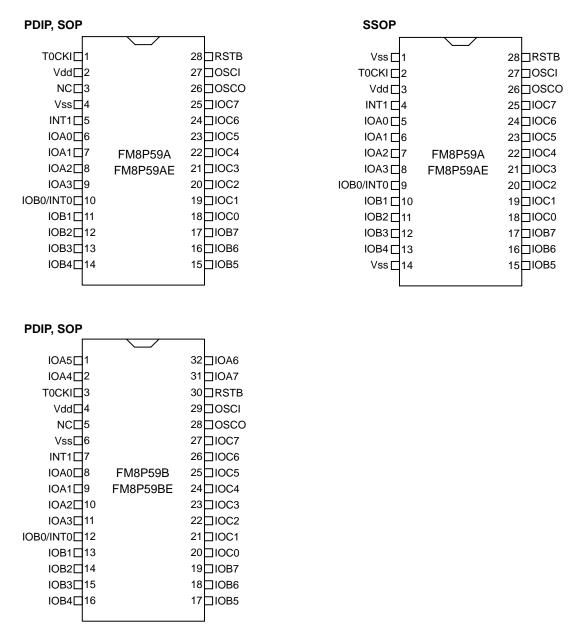

The FM8P59 series can directly or indirectly address its register files and data memory. All special function registers including the program counter are mapped in the data memory.

Vdd	-	Positive supply
Vss	-	Ground

Legend: I=input, O=output, I/O=input/output

1.0 MEMORY ORGANIZATION

FM8P59 series memory is organized into program memory and data memory.

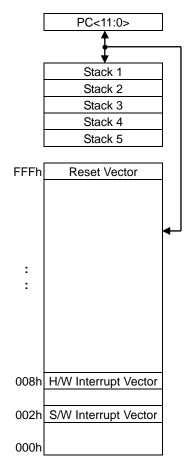

1.1 Program Memory Organization

The FM8P59 series have an 12-bit Program Counter capable of addressing a 4K×13 program memory space. The RESET vector for the FM8P59 series is at FFFh.

The H/W interrupt vector is at 008h. And the S/W interrupt vector is at 002h.

FM8P59 series has program memory size greater than 1K words, but the CALL and GOTO instructions only have a 10-bit address range. This 10-bit address range allows a branch within a 1K program memory page size. To allow CALL and GOTO instructions to address the entire 4K program memory address range for FM8P59 series, there is another two bits to specify the program memory page. This paging bit comes from the PCHBUF<3:2> bits. When doing a CALL or GOTO instruction, the user must ensure that page bit PCHBUF<3:2> are programmed so that the desired program memory page is addressed. When one of the return instructions is executed, the entire 12-bit PC is POPed from the stack. Therefore, manipulation of the PCHBUF<3:2> is not required for the return instructions. User can use "PAGE" instruction to change memory page and maintains the program memory page. Otherwise, user can use "FCALL(far call)/FGOTO(far goto)" instructions to program user's code.

FIGURE 1.1: Program Memory Map and STACK

FM8P59 Series

1.2 Data Memory Organization

Data memory is composed of Special Function Registers and General Purpose Registers.

The General Purpose Registers are accessed either directly or indirectly through the FSR register.

The Special Function Registers are registers used by the CPU and peripheral functions to control the operation of the device.

In FM8P59 series, the data memory is partitioned into four banks. Switching between these banks requires the RP1 and RP0 bits in the FSR register to be configured for the desired bank. User can use "BANK" instruction to change the data memory bank.

FSR<7:6>		Desci	ription							
Address	0 0 Bank 0	0 1 Bank 1	1 0 Bank 2	1 1 Bank 3

2.0 FUNCTIONAL DESCRIPTIONS

2.1 Operational Registers

2.1.1 INDF (Indirect Addressing Register)

Address	Name	B7	B6	B5	B4	B3	B2	B1	B0
00h (r/w)	INDF	Use	es contents	of FSR to	address da	ata memory	/ (not a phy	sical regis	ter)

The INDF Register is not a physical register. Any instruction accessing the INDF register can actually access the register pointed by FSR Register. Reading the INDF register itself indirectly (FSR="0") will read 00h. Writing to the INDF register indirectly results in a no-operation (although status bits may be affected).

The bits 5-0 of FSR register are used to select up to 64 registers (address: 00h ~ 3Fh).

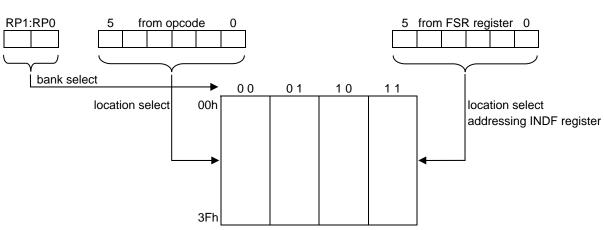

In FM8P59 series, the data memory is partitioned into four banks. Switching between these banks requires the RP1 and RP0 bits in the FSR register to be configured for the desired bank. The lower locations of each bank are reserved for the Special Function Registers. Above the Special Function Registers are General Purpose Registers. All Special Function Registers and some of General Purpose Registers from other banks are mirrored in bank 0 for code reduction and quicker access.

Accessed Bank	RP1:RP0
0	0 0
1	0 1
2	10
3	1 1

EXAMPLE 2.1: INDIRECT ADDRESSING

- Register file 38 contains the value 10h
- Register file 39 contains the value 0Ah
- Load the value 38 into the FSR Register
- A read of the INDF Register will return the value of 10h
- Increment the value of the FSR Register by one (@FSR=39h)
- A read of the INDR register now will return the value of 0Ah.

FIGURE 2.2: Direct/Indirect Addressing for FM8P59 Series

Direct Addressing

Indirect Addressing

2.1.2 TMR0 (Time Clock/Counter register)

Address	Name	B7	B6	B5	B4	B3	B2	B1	B0
01h (r/w)	TMR0			8-b	it real-time	clock/cour	iter		

The Timer0 is a 8-bit timer/counter. The clock source of Timer0 can come from the instruction cycle clock or by an external clock source (T0CKI pin) defined by T0CS bit (OPTION<5>). If T0CKI pin is selected, the Timer0 is increased by T0CKI signal rising/falling edge (selected by T0SE bit (OPTION<4>)).

The prescaler is assigned to Timer0 by clearing the PSA bit (OPTION<3>). In this case, the prescaler will be cleared when TMR0 register is written with a value.

2.1.3 PCL (Low Bytes of Program Counter) & Stack

Address	Name	B7	B6	B5	B4	B3	B2	B1	B0
02h (r/w)	PCL				Low order 8	B bits of PC	;		

FM8P59 devices have a 12-bit wide Program Counter (PC) and five-level deep 12-bit hardware push/pop stack. The low byte of PC is called the PCL register. This register is readable and writable. The high byte of PC is called the PCH register contains the PC<11:8> bits and is not directly readable or writable. All updates to the PCH register go through the PCHBUF register. As a program instruction is executed, the Program Counter will contain the address of the next program instruction to be executed. The PC value is increased by one, every instruction cycle, unless an instruction changes the PC.

For a GOTO instruction, the PC<9:0> is provided by the GOTO instruction word. The PC<11:10> is updated from the PCHBUF<3:2>. The PCL register is mapped to PC<7:0>, and the PCHBUF register is not updated.

For a CALL instruction, the PC<9:0> is provided by the CALL instruction word. The PC<11:10> is updated from the PCHBUF<3:2>. The next PC will be loaded (PUSHed) onto the top of STACK. The PCL register is mapped to PC<7:0>, and the PCHBUF register is not updated.

For a FGOTO instruction, the PC<11:0> is provided by the FGOTO instruction word. The PCL register is mapped to PC<7:0>, the PCHBUF<3:2> bits is also updated from the FGOTO instruction word, and the PCHBUF<1:0> bits are not updated.

For a FCALL instruction, the PC<11:0> is provided by the FCALL instruction word. The next PC will be loaded (PUSHed) onto the top of STACK. The PCL register is mapped to PC<7:0>, the PCHBUF<3:2> bits is also updated from the FCALL instruction word, and the PCHBUF<1:0> bits are not updated.

For a RETIA, RETFIE, or RETURN instruction, the PC are updated (POPed) from the top of STACK. The PCL register is mapped to PC<7:0>, and the PCHBUF register is not updated.

For any instruction where the PCL is the destination (excluding TBL instruction), the PC<7:0> is provided by the instruction word or ALU result. However, the PC<11:8> will come from the PCHBUF<3:0> bits (PCHBUF \rightarrow PCH). For TBL instruction, the PC<7:0> is provided by the ALU result, and the PC<9:8> are not changed. The PC<11:10> will come from the PCH<3:2> bits.

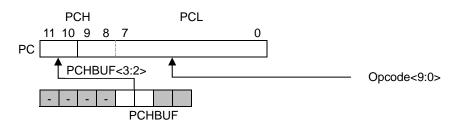

PCHBUF register is never updated with the contents of PCH.

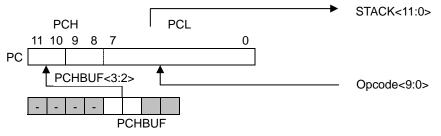

FM8P59

FIGURE 2.2: Loading of PC in Different Situations

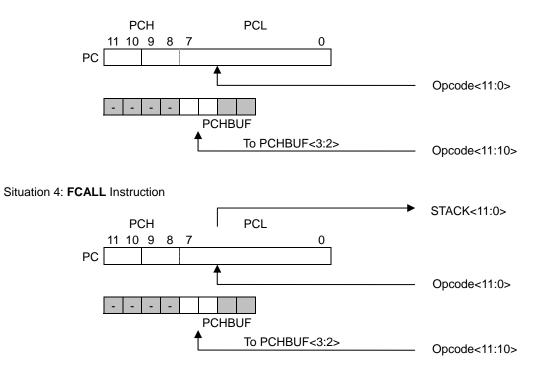

Situation 1: GOTO Instruction

Situation 2: CALL Instruction

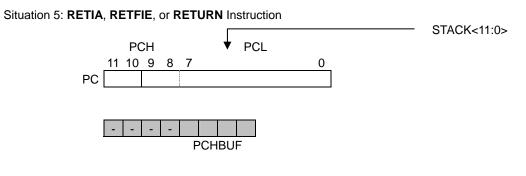

Situation 3: FGOTO Instruction

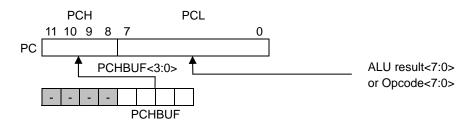

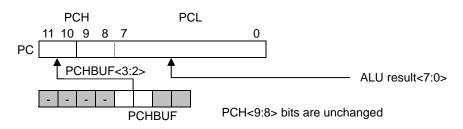

FM8P59

Situation 6: Instruction with PCL as destination (except TBL instruction)

Situation 7: TBL Instruction

Note: PCHBUF is used for instruction with PCL as destination, GOTO and CALL instructions.

2.1.4 STATUS (Status Register)

Address	Name	B7	B6	B5	B4	B3	B2	B1	B0
03h (r/w)	STATUS	GP2	GP1	GP0	TO	PD	Z	DC	С

This register contains the arithmetic status of the ALU, the RESET status.

If the STATUS Register is the destination for an instruction that affects the Z, DC or C bits, then the write to these three bits is disabled. These bits are set or cleared according to the device logic. Furthermore, the \overline{TO} and \overline{PD} bits are not writable. Therefore, the result of an instruction with the STATUS Register as destination may be different than intended. For example, CLRR STATUS will clear the upper three bits and set the Z bit. This leaves the STATUS Register as 000u u1uu (where u = unchanged).

C : Carry/borrow bit.

- ADDAR, ADDIA
- = 1, a carry occurred.
- = 0, a carry did not occur.
- SUBAR, SUBIA
- = 1, a borrow did not occur.
- = 0, a borrow occurred.
- Note : A subtraction is executed by adding the two's complement of the second operand. For rotate (RRR, RLR) instructions, this bit is loaded with either the high or low order bit of the source register.

DC : Half carry/half borrow bit.

ADDAR, ADDIA

- = 1, a carry from the 4th low order bit of the result occurred.
- = 0, a carry from the 4th low order bit of the result did not occur.

SUBAR, SUBIA

- = 1, a borrow from the 4th low order bit of the result did not occur.
- = 0, a borrow from the 4th low order bit of the result occurred.
- Z : Zero bit.
 - = 1, the result of a logic operation is zero.
 - = 0, the result of a logic operation is not zero.
- **PD** : Power down flag bit.
 - = 1, after power-up or by the CLRWDT instruction.
 - = 0, by the SLEEP instruction.
- TO : Time overflow flag bit.
 - = 1, after power-up or by the CLRWDT or SLEEP instruction.
 - = 0, a watch-dog time overflow occurred.

GP2:GP0 : General purpose read/write bits.

2.1.5 FSR (Indirect Data Memory Address Pointer)

Address	Name	B7	B6	B5	B4	B3	B2	B1	B0
04h (r/w)	FSR	RP1	RP0		Indirect	data memo	ory address	s pointer	

Bit5:Bit0 : Select registers address in the indirect addressing mode. See 2.1.1 for detail description.

RP1:RP0 : These bits are used to switching the bank of four data memory banks. User can use "BANK" instruction to change bank. See 2.1.1 for detail description.

2.1.6 PORTA, PORTB & PORTC (Port Data Registers)

Address	Name	B7	B6	B5	B4	B3	B2	B1	B0
05h (r/w)	PORTA	IOA7	IOA6	IOA5	IOA4	IOA3	IOA2	IOA1	IOA0
06h (r/w)	PORTB	IOB7	IOB6	IOB5	IOB4	IOB3	IOB2	IOB1	IOB0
07h (r/w)	PORTC	IOC7	IOC6	IOC5	IOC4	IOC3	IOC2	IOC1	IOC0

Reading the port (PORTA, PORTB, PORTC register) reads the status of the pins independent of the pin's input/output modes. Writing to these ports will write to the port data latch.

For FM8P59A devices, PORTA is a 4-bit port data Register. In this type, only the low order 4 bits are used (PORTA<3:0>) and bits 7-4 are unimplemented and read as '0's.

For FM8P59B devides, PORTA is a 8-bit port data Register.

PORTB and PORTC are 8-bit port data registers.

2.1.7 PCON (Power Control Register)

Address	Name	B7	B6	B5	B4	B3	B2	B1	B0
08h (r/w)	PCON	WDTE	EIS	LVDTE	ROC	-	-	ODC67	/WUC45

/WUC45 : = 0, Enable the input falling wake-up function of IOC4 and IOC5 pins.

= 1, Disable the input falling wake-up function of IOC4 and IOC5 pins.

ODC67 : = 0, Disable the internal open-drain of IOC6 and IOC7 pins.

- = 1, Enable the internal open-drain of IOC6 and IOC7 pins.
- Bit3:Bit2 : Not used. Read as "0"s.
- ROC : R-option function of IOC0 and IOC1 pins enable bit.
 - = 0, Disable the R-option function.
 - = 1, Enable the R-option function. In this case, if a 430KΩ external resister is connected/disconnected to Vss, the status of IOC0 (IOC1) is read as "0"/"1".
- **LVDTE** : LVDT (low voltage detector) enable bit.
 - = 0, Disable LVDT.
 - = 1, Enable LVDT.

EIS : Define the function of IOB0/INT0 pin.

- = 0, IOB0 (bi-directional I/O pin) is selected. The path of INT0 is masked.
- = 1, INT0 (external interrupt pin) is selected. In this case, the I/O control bit of IOB0 must be set to "1". The path of Port B input change of IOB0 pin is masked by hardware, the status of INT0 pin can also be read by way of reading PORTB.
- WDTE : WDT (watch-dog timer) enable bit.
 - = 0, Disable WDT.
 - = 1, Enable WDT.

2.1.8 WUCON (Port B Input Falling Wake-up Control Register)

Address	Name	B7	B6	B5	B4	B3	B2	B1	B0
09h (r/w)	WUCON	/WUB7	/WUB6	/WUB5	/WUB4	/WUB3	/WUB2	/WUB1	/WUB0

/WUB0 : = 0, Enable the input falling wake-up function of IOB0 pin.

= 1, Disable the input falling wake-up function of IOB0 pin.

FM8P59

- /WUB1 := 0, Enable the input falling wake-up function of IOB1 pin. = 1, Disable the input falling wake-up function of IOB1 pin.
- /WUB2 := 0, Enable the input falling wake-up function of IOB2 pin. = 1, Disable the input falling wake-up function of IOB2 pin.
- **/WUB3** : = 0, Enable the input falling wake-up function of IOB3 pin. = 1, Disable the input falling wake-up function of IOB3 pin.
- **/WUB4** : = 0, Enable the input falling wake-up function of IOB4 pin. = 1, Disable the input falling Wake-up function of IOB4 pin.
- **/WUB5** : = 0, Enable the input falling wake-up function of IOB5 pin. = 1, Disable the input falling wake-up function of IOB5 pin.
- **/WUB6** : = 0, Enable the input falling wake-up function of IOB6 pin. = 1, Disable the input falling wake-up function of IOB6 pin.
- **/WUB7** : = 0, Enable the input falling wake-up function of IOB7 pin. = 1, Disable the input falling wake-up function of IOB7 pin.

2.1.9 PCHBUF (High Byte Buffer of Program Counter)

Address	Name	B7	B6	B5	B4	B3	B2	B1	B0
0Ah (r/w)	PCHBUF	-	-	-	-	U	pper 4 bits	Buffer of P	OC O

PCHBUF<3:2> : Program memory page selection bits.

=	0,	0	\rightarrow	Page 0.
=	0,	1	\rightarrow	Page 1.
=	1,	0	\rightarrow	Page 2.
=	1,	1	\rightarrow	Page 3.

User can use "PAGE" instruction to change memory page and maintains the program memory page. Otherwise, user can use "FGOTO" (far goto), or "FCALL" (far call) instructions to program user's code. See 2.1.3 for detail description.

2.1.10 PDCON (Pull-down Control Register)

Address	Name	B7	B6	B5	B4	B3	B2	B1	B0
0Bh (r/w)	PDCON	/PDB3	/PDB2	/PDB1	/PDB0	/PDA3	/PDA2	/PDA1	/PDA0

/PDA0 : = 0, Enable the internal pull-down of IOA0 pin.

- = 1, Disable the internal pull-down of IOA0 pin.
- /PDA1 := 0, Enable the internal pull-down of IOA1 pin. = 1, Disable the internal pull-down of IOA1 pin.
- /PDA2 := 0, Enable the internal pull-down of IOA2 pin. = 1, Disable the internal pull-down of IOA2 pin.
- /PDA3 := 0, Enable the internal pull-down of IOA3 pin. = 1, Disable the internal pull-down of IOA3 pin.
- **/PDB0** : = 0, Enable the internal pull-down of IOB0 pin.

- = 1, Disable the internal pull-down of IOB0 pin.
- /PDB1 := 0, Enable the internal pull-down of IOB1 pin. = 1, Disable the internal pull-down of IOB1 pin.
- /PDB2 := 0, Enable the internal pull-down of IOB2 pin. = 1, Disable the internal pull-down of IOB2 pin.
- /PDB3 := 0, Enable the internal pull-down of IOB3 pin. = 1, Disable the internal pull-down of IOB3 pin.

2.1.11 BPHCON (PortB Pull-high Control Register)

Address	Name	B7	B6	B5	B4	B3	B2	B1	B0
0Ch (r/w)	BPHCON	/PHB7	/PHB6	/PHB5	/PHB4	/PHB3	/PHB2	/PHB1	/PHB0

- /PHB0 := 0, Enable the internal pull-high of IOB0 pin.= 1, Disable the internal pull-high of IOB0 pin.
- /PHB1 := 0, Enable the internal pull-high of IOB1 pin. = 1, Disable the internal pull-high of IOB1 pin.
- /PHB2 := 0, Enable the internal pull-high of IOB2 pin. = 1, Disable the internal pull-high of IOB2 pin.
- /PHB3 := 0, Enable the internal pull-high of IOB3 pin. = 1, Disable the internal pull-high of IOB3 pin.
- /PHB4 := 0, Enable the internal pull-high of IOB4 pin. = 1, Disable the internal pull-high of IOB4 pin.
- /PHB5 := 0, Enable the internal pull-high of IOB5 pin. = 1, Disable the internal pull-high of IOB5 pin.
- /PHB6 := 0, Enable the internal pull-high of IOB6 pin.= 1, Disable the internal pull-high of IOB6 pin.
- /PHB7 := 0, Enable the internal pull-high of IOB7 pin. = 1, Disable the internal pull-high of IOB7 pin.

2.1.12 CPHCON (PortC Pull-high Control Register)

Address	Name	B7	B6	B5	B4	B3	B2	B1	B0
0Dh (r/w)	CPHCON	/PHC7	/PHC6	/PHC5	/PHC4	/PHC3	/PHC2	/PHC1	/PHC0

- **/PHC0** : = 0, Enable the internal pull-high of IOC0 pin. = 1, Disable the internal pull-high of IOC0 pin.
- /PHC1 := 0, Enable the internal pull-high of IOC1 pin. = 1, Disable the internal pull-high of IOC1 pin.
- **/PHC2** : = 0, Enable the internal pull-high of IOC2 pin. = 1, Disable the internal pull-high of IOC2 pin.

- /PHC3 := 0, Enable the internal pull-high of IOC3 pin. = 1, Disable the internal pull-high of IOC3 pin.
- /PHC4 := 0, Enable the internal pull-high of IOC4 pin. = 1, Disable the internal pull-high of IOC4 pin.
- /PHC5 := 0, Enable the internal pull-high of IOC5 pin.= 1, Disable the internal pull-high of IOC5 pin.
- /PHC6 : = 0, Enable the internal pull-high of IOC6 pin. = 1, Disable the internal pull-high of IOC6 pin.
- **/PHC7** : = 0, Enable the internal pull-high of IOC7 pin. = 1, Disable the internal pull-high of IOC7 pin.

2.1.13 INTEN (Interrupt Mask Register)

Address	Name	B7	B6	B5	B4	B3	B2	B1	B0
0Eh (r/w)	INTEN	GIE	-	-	-	INT1IE	INT0IE	-	T0IE

- **TOIE** : Timer0 overflow interrupt enable bit.
 - = 0, Disable the Timer0 overflow interrupt.
 - = 1, Enable the Timer0 overflow interrupt.
- Bit1 : Not used. Read as "0".
- **INTOIE** : External INTO pin interrupt enable bit.
 - = 0, Disable the External INT0 pin interrupt.
 - = 1, Enable the External INT0 pin interrupt.
- INT1IE : External INT1 pin interrupt enable bit.
 - = 0, Disable the External INT1 pin interrupt.
 - = 1, Enable the External INT1 pin interrupt.
- Bit6:BIT4 : Not used. Read as "0"s.
- GIE : Global interrupt enable bit.
 - = 0, Disable all interrupts.
 - = 1, Enable all un-masked interrupts.
 - Note : When an interrupt event occur with the GIE bit and its corresponding interrupt enable bit are all set, the GIE bit will be cleared by hardware to disable any further interrupts. The RETFIE instruction will exit the interrupt routine and set the GIE bit to re-enable interrupt.

2.1.14 INTFLAG (Interrupt Status Register)

Address	Name	B7	B6	B5	B4	B3	B2	B1	B0
0Fh (r/w)	INTFLAG	-	-	-	-	INT1IF	INTOIF	-	T0IF

TOIF : Timer0 overflow interrupt flag. Set when Timer0 overflows, reset by software.

Bit1 : Not used. Read as "0".

INTOIF: External INT0 pin interrupt flag. Set by rising/falling (selected by INTEDG bit (OPTION<6>)) edge on INT0 pin, reset by software.

INT1IF : External INT1 pin interrupt flag. Set by falling edge on INT1 pin, reset by software.

Bit7:BIT4 : Not used. Read as "0"s.

2.1.15 ACC (Accumulator)

Address	Name	B7	B6	B5	B4	B3	B2	B1	B0
N/A (r/w)	ACC				Accum	nulator			

Accumulator is an internal data transfer, or instruction operand holding. It can not be addressed.

2.1.16 OPTION Register

Address	Name	B7	B6	B5	B4	B3	B2	B1	B0
N/A (w)	OPTION	-	INTEDG	TOCS	TOSE	PSA	PS2	PS1	PS0

Accessed by OPTION instruction.

By executing the OPTION instruction, the contents of the ACC Register will be transferred to the OPTION Register. The OPTION Register is a 7-bit wide, write-only register which contains various control bits to configure the Timer0/WDT prescaler, Timer0, and the external INT interrupt.

The OPTION Register are "write-only" and are set all "1"s except INTEDG bit.

PS2:PS0 : Prescaler rate select bits.

PS2:PS0	Timer0 Rate	WDT Rate
000	1:2	1:1
001	1:4	1:2
0 1 0	1:8	1:4
011	1:16	1:8
100	1:32	1:16
101	1:64	1:32
1 1 0	1:128	1:64
1 1 1	1:256	1:128

PSA : Prescaler assign bit.

- = 1, WDT (watch-dog timer).
- = 0, TMR0 (Timer0).

TOSE : TMR0 source edge select bit.

- = 1, Falling edge on T0CKI pin.
- = 0, Rising edge on T0CKI pin.
- TOCS : TMR0 clock source select bit.
 - = 1, External T0CKI pin.
 - = 0, internal instruction clock cycle.

INTEDG : INT0 pin interrupt edge select bit.

- = 1, interrupt on rising edge of INT0 pin.
- = 0, interrupt on falling edge of INT0 pin.

Bit7 : Not used.

2.1.17 IOSTA, IOSTB & IOSTC (Port I/O Control Registers)

Address	Name	B7	B6	B5	B4	B3	B2	B1	B0
N/A (w)	IOSTA			Po	ort A I/O Co	ntrol Regis	ter		
N/A (w)	IOSTB			Po	rt B I/O Co	ntrol Regis	ter		
N/A (w)	IOSTC			Po	rt C I/O Co	ntrol Regis	ter		

Accessed by IOST instruction.

The Port I/O Control Registers are loaded with the contents of the ACC Register by executing the IOST R (05h~07h) instruction. A '1' from a IOST Register bit puts the corresponding output driver in hi-impedance state (input mode). A '0' enables the output buffer and puts the contents of the output data latch on the selected pins (output mode). The IOST Registers are "write-only" and are set (output drivers disabled) upon RESET.

2.2 I/O Ports

Port A, port B and port C are bi-directional tri-state I/O ports. Port A is a 4-pin I/O port for FM8P59A, and port A is a 8-pin I/O port for FM8P59B. Port B and port C are 8-pin I/O ports.

All I/O pins (IOA<7:0>, IOB<7:0> and IOC<7:0>) have data direction control registers (IOSTA, IOSTB, IOSTC) which can configure these pins as output or input.

IOB<7:0> and IOC<7:0> have its corresponding pull-high control bits (BPHCON and CPHCON registers) to enable the weak internal pull-high. The weak pull-high is automatically turned off when the pin is configured as an output pin.

IOA<3:0> and IOB<3:0> have its corresponding pull-down control bits (PDCON register) to enable the weak internal pull-down. The weak pull-down is automatically turned off when the pin is configured as an output pin.

IOC<7:6> have its corresponding open-drain control bit (ODC67 bit (PCON<1>)) to enable the open-drain output when these pins are configured to be an output pin.

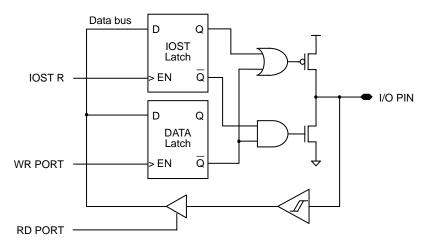

IOA0 and IOA1 are the R-option pins enabled by setting the ROC bit (PCON<4>). When the R-option function is used, it is recommended that IOA0 and IOA1 are used as output pins, and read the status of IOA0 and IOA1 before these pins are configured to be an output pin.

IOB<7:0> and IOC<5:4> also provide the input falling wake-up function. Each pin has its corresponding input falling wake-up enable bits (WUCON register and /WUC45 bit (PCON<0>)) to select the input falling wake-up source. The IOB0 is also an external interrupt input signal by setting the EIS bit (PCON<6>). In this case, IOB0 input falling wake-up function will be disabled by hardware even if it is enabled by software.

2.3 Timer0/WDT & Prescler

2.3.1 Timer0

The Timer0 is a 8-bit timer/counter. The clock source of Timer0 can come from the internal clock or by an external clock source (T0CKI pin).

2.3.1.1 Using Timer0 with an Internal Clock : Timer mode

Timer mode is selected by clearing the T0CS bit (OPTION<5>). In timer mode, the timer0 register (TMR0) will increment every instruction cycle (without prescaler). If TMR0 register is written, the increment is inhibited for the following two cycles.

2.3.1.2 Using Timer0 with an External Clock : Counter mode

Counter mode is selected by setting the T0CS bit (OPTON<5>). In this mode, Timer0 will increment either on every rising or falling edge of pin T0CKI. The incrementing edge is determined by the source edge select bit T0SE (OPTION<4>).

The external clock requirement is due to internal phase clock (Tosc) synchronization. Also, there is a delay in the actual incrementing of Timer0 after synchronization.

When no prescaler is used, the external clock input is the same as the prescaler output. The synchronization of T0CKI with the internal phase clocks is accomplished by sampling the prescaler output on the T2 and T4 cycles of the internal phase clocks. Therefore, it is necessary for T0CKI to be high for at least 2 T_{OSC} and low for at least 2 Tosc.

When a prescaler is used, the external clock input is divided by the asynchronous prescaler. For the external clock to meet the sampling requirement, the ripple counter must be taken into account. Therefore, it is necessary for TOCKI to have a period of at least 4Tosc divided by the prescaler value.

2.3.2 Watchdog Timer (WDT)

The Watchdog Timer (WDT) is a free running on-chip RC oscillator which does not require any external components. So the WDT will still run even if the clock on the OSCI and OSCO pins is turned off, such as in SLEEP mode. During normal operation or in SLEEP mode, a WDT time-out will cause the device reset and the \overline{TO} bit (STATUS<4>) will be cleared.

The WDT can be disabled by clearing the control bit WDTE (PCON<7>) to "0".

The WDT has a nominal time-out period of 18 ms (without prescaler). If a longer time-out period is desired, a prescaler with a division ratio of up to 1:128 can be assigned to the WDT controlled by the OPTION register. Thus, the longest time-out period is approximately 2.3 seconds.

The CLRWDT instruction clears the WDT and the prescaler, if assigned to the WDT, and prevents it from timing out and generating a device reset.

The SLEEP instruction resets the WDT and the prescaler, if assigned to the WDT. This gives the maximum SLEEP time before a WDT Wake-up Reset.

2.3.3 Prescaler

An 8-bit counter (down counter) is available as a prescaler for the Timer0, or as a postscaler for the Watchdog Timer (WDT). Note that the prescaler may be used by either the Timer0 module or the WDT, but not both. Thus, a

prescaler assignment for the Timer0 means that there is no prescaler for the WDT, and vice-versa. The PSA bit (OPTION<3>) determines prescaler assignment. The PS<2:0> bits (OPTION<2:0>) determine prescaler ratio.

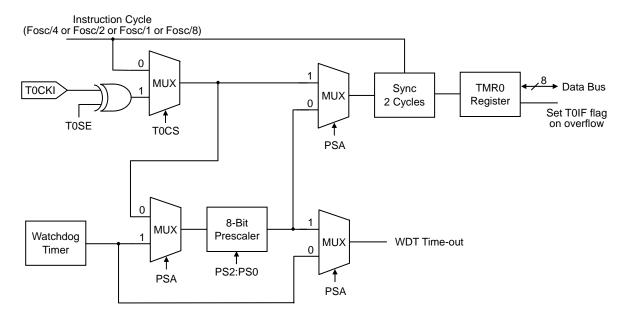

When the prescaler is assigned to the Timer0 module, all instructions writing to the TMR0 register will clear the prescaler. When it is assigned to WDT, a CLRWDT instruction will clear the prescaler along with the WDT. The prescaler is neither readable nor writable. On a RESET, the prescaler contains all '1's.

To avoid an unintended device reset, CLRWDT or CLRR TMR0 instructions must be executed when changing the prescaler assignment from Timer0 to the WDT, and vice-versa.

FM8P59

FIGURE 2.4: Block Diagram of The Timer0/WDT Prescaler

2.4 Interrupts

The FM8P59 series has up to three sources of interrupt:

- 1. External interrupt INT0 pin.
- 2. External interrupt INT1 pin.
- 3. TMR0 overflow interrupt.

INTFLAG is the interrupt flag register that recodes the interrupt requests in the relative flags.

A global interrupt enable bit, GIE (INTEN<7>), enables (if set) all un-masked interrupts or disables (if cleared) all interrupts. Individual interrupts can be enabled/disabled through their corresponding enable bits in INTEN register regardless of the status of the GIE bit.

When an interrupt event occur with the GIE bit and its corresponding interrupt enable bit are all set, the GIE bit will be cleared by hardware to disable any further interrupts, and the next instruction will be fetched from address 008h. The interrupt flag bits must be cleared by software before re-enabling GIE bit to avoid recursive interrupts. The RETFIE instruction exits the interrupt routine and set the GIE bit to re-enable interrupt.

The flag bit in INTFLAG register is set by interrupt event regardless of the status of its mask bit. Reading the

INTFLAG register will be the logic AND of INTFLAG and INTEN.

When an interrupt is generated by the INT instruction, the next instruction will be fetched from address 002h.

2.4.1 External INT0 Interrupt

External interrupt on INT0 pin is rising or falling edge triggered selected by INTEDG (OPTION<6>). When a valid edge appears on the INT0 pin the flag bit INT0IF (INTFLAG<2>) is set. This interrupt can be disabled by clearing INT0IE bit (INTEN<2>).

2.4.2 External INT1 Interrupt

External interrupt on INT1 pin is falling edge triggered.

When a falling edge appears on the INT1 pin the flag bit INT1IF (INTFLAG<3>) is set. This interrupt can be disabled by clearing INT1IE bit (INTEN<3>).

2.4.3 Timer0 Interrupt

An overflow (FFh \rightarrow 00h) in the TMR0 register will set the flag bit T0IF (INTFLAG<0>). This interrupt can be disabled by clearing T0IE bit (INTEN<0>).

2.5 Power-down Mode (SLEEP)

Power-down mode is entered by executing a SLEEP instruction.

When SLEEP instruction is executed, the \overline{PD} bit (STATUS<3>) is cleared, the \overline{TO} bit is set, the watchdog timer will be cleared and keeps running, and the oscillator driver is turned off.

All I/O pins maintain the status they had before the SLEEP instruction was executed.

2.5.1 Wake-up from SLEEP Mode

The device can wake-up from SLEEP mode through one of the following events:

- 1. RSTB reset.
- 2. WDT time-out reset (if enabled).
- 3. PORTB/IOC4/IOC5 input falling.

External RSTB reset and WDT time-out reset will cause a device reset. The \overline{PD} and \overline{TO} bits can be used to determine the cause of device reset. The \overline{PD} bit is set on power-up and is cleared when SLEEP instruction is executed. The \overline{TO} bit is cleared if a WDT time-out occurred.

For the device to wake-up through an PORTB/IOC4/IOC5 input falling event, and the program will execute next PC after wake-up. Any pin which corresponding /WUBn bit (WUCON<7:0>) or /WUC45 bit (PCON<0>) is set to "1" or configured as output will be excluded from this function.

The system wake-up delay time is 18ms plus 128 oscillator cycle time.

2.6 Reset

FM8P59 devices may be RESET in one of the following ways:

- 1. Power-on Reset (POR)
- 2. Brown-out Reset (BOR)
- 3. RSTB Pin Reset
- 4. WDT time-out Reset

Some registers are not affected in any RESET condition. Their status is unknown on Power-on Reset and unchanged in any other RESET. Most other registers are reset to a "reset state" on Power-on Reset, RSTB or WDT Reset.

A Power-on RESET pulse is generated on-chip when Vdd rise is detected. To use this feature, the user merely ties the RSTB pin to Vdd.

On-chip Low Voltage Detector (LVD) places the device into reset when Vdd is below a fixed voltage. This ensures that the device does not continue program execution outside the valid operation Vdd range. Brown-out RESET is typically used in AC line or heavy loads switched applications.

A RSTB or WDT Wake-up from SLEEP also results in a device RESET, and not a continuation of operation before SLEEP.

The $\overline{\text{TO}}$ and $\overline{\text{PD}}$ bits (STATUS<4:3>) are set or cleared depending on the different reset conditions.

2.6.1 Power-up Reset Timer(PWRT)

The Power-up Reset Timer provides a nominal 18ms delay after Power-on Reset (POR), Brown-out Reset (BOR), RSTB Reset or WDT time-out Reset. The device is kept in reset state as long as the PWRT is active. The PWDT delay will vary from device to device due to Vdd, temperature, and process variation.

2.6.2 Oscillator Start-up Timer(OST)

The OST timer provides a 128 oscillator cycle delay (from OSCI input) after the PWRT delay (18ms) is over. This delay ensures that the X'tal oscillator or resonator has started and stabilized. The device is kept in reset state as

long as the OST is active.

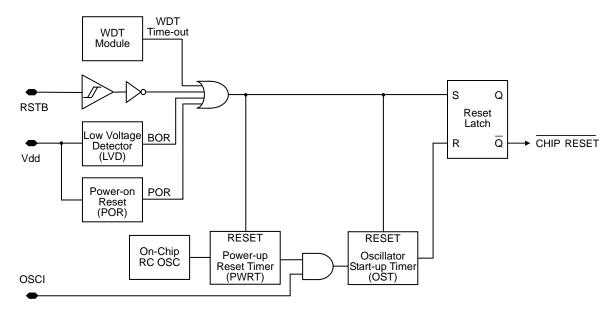

This counter only starts incrementing after the amplitude of the OSCI signal reaches the oscillator input thresholds.

2.6.3 Reset Sequence

When Power-on Reset (POR), Brown-out Reset (BOR), RSTB Reset or WDT time-out Reset is detected, the reset sequence is as follows:

- 1. The reset latch is set and the PWRT & OST are cleared.
- 2. When the internal POR, BOR, RSTB Reset or WDT time-out Reset pulse is finished, then the PWRT begins counting.
- 3. After the PWRT time-out, the OST is activated.
- 4. And after the OST delay is over, the reset latch will be cleared and thus end the on-chip reset signal.

The totally system reset delay time is 18ms plus 128 oscillator cycle time.

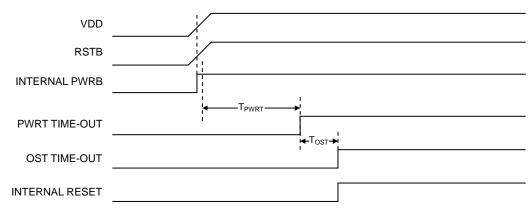

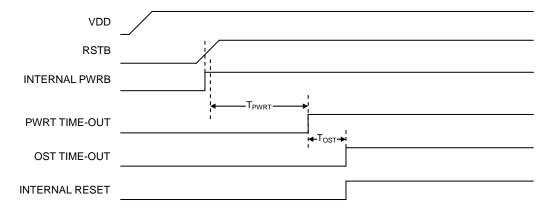

FIGURE 2.6: Time-out Sequence on Power-up (RSTB Pin Tied to Vdd)

Note: $T_{PWRT} = 18 \text{ ms}$; $T_{OST} = 128 \text{ oscillator cycle time}$

FIGURE 2.7: Time-out Sequence on Power-up (RSTB Pin Not Tied to Vdd)

Note: T_{PWRT} = 18 ms; T_{OST} = 128 oscillator cycle time

2.7 Hexadecimal Convert to Decimal (HCD)

Decimal format is another number format for FM8P59 series. When the content of the data memory has been assigned as decimal format, it is necessary to convert the results to decimal format after the execution of ALU instructions. When the decimal converting operation is processing, all of the operand data (including the contents of the data memory (RAM), accumulator (ACC), immediate data, and look-up table) should be in the decimal format, or the results of conversion will be incorrect.

Instruction DAA can convert the ACC data from hexadecimal to decimal format after any addition operation and restored to ACC.

The conversion operation is illustrated in example 2.2.

EXAMPLE 2.2: DAA CONVERSION

MOVIA	90h	;Set immediate data = decimal format number "90" (ACC \leftarrow 90h)
MOVAR	30h	;Load immediate data "90" to data memory address 30H
MOVIA	10h	;Set immediate data = decimal format number "10" (ACC < 10h)
ADDAR	30h, 0	;Contents of the data memory address 30H and ACC are binary-added
		;the result loads to the ACC (ACC \leftarrow A0h, C \leftarrow 0)
DAA		;Convert the content of ACC to decimal format, and restored to ACC
		;The result in the ACC is "00" and the carry bit C is "1". This represents the
		;decimal number "100"

Instruction DAS can convert the ACC data from hexadecimal to decimal format after any subtraction operation and restored to ACC.

The conversion operation is illustrated in example 2.3.

EXAMPLE 2.3: DAS CONVERSION

MOVIA	10h	;Set immediate data = decimal format number "10" (ACC < 10h)
MOVAR	30h	;Load immediate data "10" to data memory address 30H
MOVIA	20h	;Set immediate data = decimal format number "20" (ACC C 20h)
SUBAR	30h, 0	;Contents of the data memory address 30H and ACC are binary-subtracted
		;the result loads to the ACC (ACC \leftarrow F0h, C \leftarrow 0)
DAS		;Convert the content of ACC to decimal format, and restored to ACC
		;The result in the ACC is "90" and the carry bit C is "0". This represents the
		;decimal number " -10"

2.8 Oscillator Configurations

FM8P59 series can be operated in four different oscillator modes. Users can program two configuration bits (Fosc<1:0>) to select the appropriate modes:

- LF: Low Frequency Crystal Oscillator
- XT: Crystal/Resonator Oscillator
- HF: High Frequency Crystal/Resonator Oscillator
- ERC: External Resistor/Capacitor Oscillator

In LF, XT, or HF modes, a crystal or ceramic resonator in connected to the OSCI and OSCO pins to establish oscillation. When in LF, XT, or HF modes, the devices can have an external clock source drive the OSCI pin. The ERC device option offers additional cost savings for timing insensitive applications. The RC oscillator frequency is a function of the supply voltage, the resistor (Rext) and capacitor (Cext), the operating temperature, and the process parameter.

FIGURE 2.8: HF, XT or LF Oscillator Modes (Crystal Operation or Ceramic Resonator)

FCALL	I	Call subroutine	I → PC<11:0>	3	-
			I<11:10> → PCHBUF<3:2>		
FGOTO	I	Unconditional branch	I → PC<11:0>	3	
10010	•		I<11:10> → PCHBUF<3:2>	3	-

Note: 1. 2 cycles for skip, else 1 cycle. (3 cycles if skip and followed by a 2-word instruction FCALL/FGOTO)

2. bit : Bit address within an 8-bit register R

R : Register address (00h to 3Fh)

I : Immediate data

ACC : Accumulator

d : Destination select;

=0 (store result in ACC)

=1 (store result in file register R)

dest : Destination

PC : Program Counter

PCHBUF : High Byte Buffer of Program Counter

WDT : Watchdog Timer Counter

GIE : Global interrupt enable bit

TO : Time-out bit

PD : Power-down bit

C : Carry bit

DC : Digital carry bit

Z : Zero bit

ADCAR	Add ACC and R with Carry
Syntax:	ADCAR R, d
Operands:	0≤R≤63
	$d \in [0,1]$
Operation:	$R + ACC + C \rightarrow dest$
Status Affected:	C, DC, Z
Description:	Add the contents of the ACC register and register 'R' with Carry. If 'd' is 0 the result is stored
	in the ACC register. If 'd' is '1' the result is stored back in register 'R'.
Cycles:	1
ADDAR	Add ACC and R
Syntax:	ADDAR R, d
Operands:	$0 \le R \le 63$
	d∈[0,1]
Operation:	ACC + R \rightarrow dest
Status Affected:	C, DC, Z
Description:	Add the contents of the ACC register and register 'R'. If 'd' is 0 the result is stored in the ACC
	register. If 'd' is '1' the result is stored back in register 'R'.
Cycles:	1
ADDIA	Add ACC and Immediate
Syntax:	ADDIA I
Operands:	0≤1≤255
Operation:	$ACC + I \rightarrow ACC$
Status Affected:	C, DC, Z
Description:	Add the contents of the ACC register with the 8-bit immediate 'I'. The result is placed in the
	ACC register.
Cycles:	1
ANDAR	AND ACC and R
Syntax:	ANDAR R, d
Operands:	0≤R≤63
	d∈[0,1]
Operation:	ACC and R \rightarrow dest
Status Affected:	Z
Description:	The contents of the ACC register are AND'ed with register 'R'. If 'd' is 0 the result is stored in the ACC register. If 'd' is '1' the result is stored back in register 'R'.
Cycles:	1
ANDIA	AND Immediate with ACC
Syntax:	ANDIA I
Operands:	0≤1≤255
Operation:	ACC AND I \rightarrow ACC
Status Affected:	Z
Description:	The contents of the ACC register are AND'ed with the 8-bit immediate 'I'. The result is placed in the ACC register.
Cycles:	1

BANK	Move Immediate to memory bank bits
Syntax:	BANKI
Operands:	0≤1≤3
Operation:	I → RP<1:0>
Status Affected:	None
Description:	The memory bank bits are loaded with the 2-bit immediate 'I'.
Cycles:	1
BCR	Clear Bit in R
Syntax:	BCF R, b
Operands:	$0 \le R \le 63$
	0≤b≤7
Operation:	$0 \rightarrow \text{R} < \text{b} >$
Status Affected:	None
Description:	Clear bit 'b' in register 'R'.
Cycles:	1
BSR	Set Bit in R
Syntax:	BSR R, b
Operands:	$0 \le R \le 63$
	$0 \le b \le 7$
Operation:	1 → R
Status Affected:	None
Description:	Set bit 'b' in register 'R'.
Cycles:	1
Cycles: BTRSC	1 Test Bit in R, Skip if Clear
-	
BTRSC	Test Bit in R, Skip if Clear
BTRSC Syntax:	Test Bit in R, Skip if Clear BTRSC R, b

Operation: $\overline{R} \rightarrow dest$	Operands:	
•	_	
	•	
	Status Affected:	Z
Description: The contents of register 'R' are complemented. If 'd' is 0 the result is stored in the ACC register. If 'd' is 1 the result is stored back in register 'R'.	Description:	
Cycles: 1	Cycles:	

DAA	Adjust ACC's data format from HEX to DEC
Syntax:	DAA
Operands:	None
Operation:	$ACC(hex) \rightarrow ACC(dec)$
Status Affected:	C
Description:	Convert the ACC data from hexadecimal to decimal format after any addition
·	operation and restored to ACC.
Cycles:	1
DAS	Adjust ACC's data format from HEX to DEC
Syntax:	DAS
Operands:	None
Operation:	$ACC(hex) \rightarrow ACC(dec)$
Status Affected:	None
Description:	Convert the ACC data from hexadecimal to decimal format after any subtraction operation and restored to ACC.
Cycles:	1
DECR	Decrement R
Syntax:	DECR R, d
Operands:	$0 \le R \le 63$
	$d \in [0,1]$
Operation:	$R - 1 \rightarrow dest$
Status Affected:	Z
Description:	Decrement register 'R'. If 'd' is 0 the result is stored in the ACC register. If 'd' is 1 the result is
·	stored back in register 'R'.
Cycles:	1
DECRSZ	Decrement R, Skip if 0
Syntax:	DECRSZ R, d
Operands:	0≤R≤63
	d∈[0,1]
Operation:	R - 1 \rightarrow dest; skip if result =0
Status Affected:	None
Description:	The contents of register 'R' are decremented. If 'd' is 0 the result is placed in the ACC
	register. If 'd' is 1 the result is placed back in register 'R'.
	If the result is 0, the next instruction, which is already fetched, is discarded and a NOP is
	executed instead making it a two-cycle instruction.
Cycles:	1/2 (3 cycles if skip and followed by a 2-word instruction FCALL/FGOTO)
FCALL	Subroutine Call
Syntax:	FCALL I
Operands:	0≤1≤4095
Operation:	PC +1 \rightarrow Top of Stack;
	I → PC<11:0>
	I<11:10> → PCHBUF<3:2>
Status Affected:	None
Description:	Subroutine call. First, return address (PC+1) is pushed onto the stack. The 12-bit immediate
	address is loaded into PC bits <11:0>. FCALL is a two-word (three-cycle) instruction.
Cycles:	3

IORAR	OR ACC with R
Syntax:	IORAR R, d
Operands:	0≤R≤63
	d∈[0,1]
Operation:	ACC or R \rightarrow dest
Status Affected:	Z
Description:	Inclusive OR the ACC register with register 'R'. If 'd' is 0 the result is placed in the ACC
	register. If 'd' is 1 the result is placed back in register 'R'.
Cycles:	1
IORIA	OR Immediate with ACC
Syntax:	IORIA I 0≤1≤255
Operands:	
Operation: Status Affected:	ACC or $I \rightarrow ACC$
	Z The contents of the ACC register are OP'ed with the 8 bit immediate (1). The regult is pleased
Description:	The contents of the ACC register are OR'ed with the 8-bit immediate 'I'. The result is placed in the ACC register
Cycles	in the ACC register.
Cycles:	1
IOST	Load IOST Register
Syntax:	IOST R
Operands:	R = 5,6 or 7
Operation:	ACC \rightarrow IOST register R
Status Affected:	None
Description:	IOST register 'R' (R= 5,6 or 7) is loaded with the contents of the ACC register.
Cycles:	1
2	
MOVAR	Move ACC to R
Syntax:	MOVAR R
Syntax: Operands:	$\begin{array}{c} \text{MOVAR } R \\ 0 \leq R \leq 63 \end{array}$

NOP	No Operation				
Syntax:	NOP				
Operands:	None				
Operation:	No operation				
Status Affected:	None				
Description:	No operation.				
Cycles:	1				
,					
OPTION	Load OPTION Register				
Syntax:	OPTION				
Operands:	None				
Operation:	$ACC \rightarrow OPTION$				
Status Affected:	None				
Description:	The content of the ACC register is loaded into the OPTION register.				
Cycles:	1				
PAGE	Move Immediate to program page bits				
Syntax:	PAGE I				
Operands:	0≤1≤3				
Operation:	I → PCHBUF<3:2>				
Status Affected:	None				
Description:	The program page bits are loaded with the 2-bit immediate 'I'.				
Cycles:	1				
eyelee!					
RETFIE	Return from Interrupt, Set 'GIE' Bit				
Syntax:	RETFIE				
Operands:	None				
Operation:	Top of Stack \rightarrow PC				
Status Affected:	None				
Description:	The program counter is loaded from the top of the stack (the return address). The 'GIE' bit is				
	set to 1. This is a two-cycle instruction.				
Cycles:	2				
RETIA	Return with Immediate in ACC				
Syntax:	RETIA I				
Operands:	0≤1≤255				
Operation:	$I \rightarrow ACC;$				
	Top of Stack \rightarrow PC				
Status Affected:	None				
Description:	The ACC register is loaded with the 8-bit immediate 'I'. The program counter is loaded from				
. .	the top of the stack (the return address). This is a two-cycle instruction.				
Cycles:	2				
RETURN	Return from Subroutine				
Syntax:	RETURN				
Operands:	None				
Operation:	Top of Stack \rightarrow PC				
Status Affected:	None				
Description:	The program counter is loaded from the top of the stack (the return address). This is a				
Cycles:	two-cycle instruction. 2				
Cycles.	2				

RLR Rotate Left f through Carry Syntax: RLR R, d	
Syniax. RLR R, U	
Operands: $0 \le R \le 63$	
d∈[0,1]	
Operation: $R < 7 > \rightarrow C;$	
$R < 6:0 \rightarrow dest < 7:1 >;$	
$C \rightarrow dest<0>$	
Status Affected: C	
Description: The contents of register 'R' are rotated one bit to the left through the Carry Flag. If	f 'd' is 0 the
result is placed in the ACC register. If 'd' is 1 the result is stored back in register 'l	R'.
Cycles: 1	
RRR Rotate Right f through Carry	
Syntax: RRR R, d	
Operands: $0 \le R \le 63$	
$d \in [0,1]$	
Operation: $C \rightarrow dest < 7 >;$	
$R<7:1> \rightarrow dest<6:0>;$	
$R_{<0>} \rightarrow C$	
Status Affected: C	
Description: The contents of register 'R' are rotated one bit to the right through the Carry Flag. If	
result is placed in the ACC register. If 'd' is 1 the result is placed back in register '	R.

SUBAR	Subtract ACC from R
Syntax:	SUBAR R, d
Operands:	$0 \le R \le 63$
·	d∈[0,1]
Operation:	$R - ACC \rightarrow dest$
Status Affected:	C, DC, Z
Description:	Subtract (2's complement method) the ACC register from register 'R'. If 'd' is 0 the result is
Cycles:	stored in the ACC register. If 'd' is 1 the result is stored back in register 'R'.
SUBIA	Subtract ACC from Immediate
Syntax:	SUBIA I
Operands:	0≤1≤255
Operation:	$I - ACC \rightarrow ACC$
Status Affected:	C, DC, Z
Description:	Subtract (2's complement method) the ACC register from the 8-bit immediate 'I'. The result is
	placed in the ACC register.
Cycles:	1
SWAPR	Swap nibbles in R
Syntax:	SWAPR R, d
Operands:	$0 \le R \le 63$
	d∈[0,1]
Operation:	$R<3:0> \rightarrow dest<7:4>;$
	$R<7:4> \rightarrow dest<3:0>$
Status Affected:	None
Description:	The upper and lower nibbles of register 'R' are exchanged. If 'd' is 0 the result is placed in
	ACC register. If 'd' is 1 the result in placed in register 'R'.
Cycles:	1
TBL	Table Look-up
Syntax:	TBL
Operands:	None
Operation:	PC<7:0> + ACC → PC<7:0>
·	PC<9:8> unchanged
	PCHBUF<3:2> → PC<11:10>
Status Affected:	C, DC, Z
Description:	Operate with RETIA to look-up table
Cycles:	1
XORAR	Exclusive OR ACC with R
Syntax:	XORAR R, d
Operands:	0≤R≤63
	d∈[0,1]
Operation:	ACC xor $R \rightarrow dest$
Status Affected:	Z
Description:	Exclusive OR the contents of the ACC register with register 'R'. If 'd' is 0 the result is stored in
Cycles:	the ACC register. If 'd' is 1 the result is stored back in register 'R'.

XORIA	Exclusive OR Immediate with ACC
Syntax:	XORIA I
Operands:	0≤1≤255
Operation:	ACC xor I \rightarrow ACC
Status Affected:	Z
Description:	The contents of the ACC register are XOR'ed with the 8-bit immediate 'I'. The result is placed in the ACC register.
Cycles:	1
