500mA USB-Compatible Lithium Ion Battery Charger CN3051A/CN3052A

General Description:

The CN3051A/CN3052A is a complete constant-current /constant voltage linear charger for single cell Li-ion and Li Polymer rechargeable batteries. The device contains an on-chip power MOSFET and eliminates the need for the external sense resistor and blocking diode. Furthermore, the CN3051A/CN3052A is specifically designed to work within USB power specifications. Its low external component count makes CN3051A/CN3052A ideally suited for portable applications.

Thermal feedback regulates the charge current to limit the die temperature during high power operation or high ambient temperature. The regulation voltage is fixed at 4.1V(CN3051A) or 4.2V(CN3052A) with 1% accuracy. The charge current can be programmed externally with a single resistor. When the input supply (wall adapter or USB supply) is removed, the CN3051A/CN3052A automatically enters a low power sleep mode, dropping the battery drain current to less than 3uA. Other features include undervoltage lockout, automatic recharge, chip enable function, battery temperature sensing and a CHRG pin to indicate charge status.

The CN3051A/CN3052A is available in a thermally enhanced 8-pin SOP package.

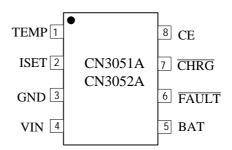

Applications:

- Cellular Telephones
- Digital Still Cameras
- MP3 Players
- Bluetooth Applications
- USB Bus-Powered Chargers

Features:

- Charges Single Cell Li-Ion Batteries Directly from USB Port or AC Adaptor
- On-chip Power MOSFET
- No external Blocking Diode or Current Sense Resistors Required
- Preset 4.1V or 4.2V Regulation Voltage with 1% Accuracy
- Precharge Conditioning for Reviving Deeply
 Discharged Cells and Minimizing Heat
 Dissipation During Initial Stage of Charge
- Programmable Charge Current Up to 500mA
- Constant-Current/Constant-Voltage Operation with Thermal Regulation to Maximize Charge Rate Without Risk of Overheating
- Automatic Low-Power Sleep Mode When Input Supply Voltage is Removed
- Status Indication for LEDs or uP Interface
- C/10 Charge Termination
- Automatic Recharge
- Battery Temperature Sensing
- Chip Enable Input
- Available in SOP8 Package
- Pb-free Available

Pin Description

Pin No.	Name	Function Description		
		Temperature Sense Input. Connecting TEMP pin to NTC thermistor's		
		output in Lithium ion battery pack. If TEMP pin's voltage is below 45% or		
		above 80% of supply voltage V _{IN} for more than 0.15S, this means that battery's		
1	TEMD	temperature is too high or too low, charging is suspended, and FAULT pin is		
	TEMP	pulled low to indicate a battery fault state. If TEMP's voltage level is between		
		45% and 80% of supply voltage for more than 0.15S, battery fault state is		
		released, FAULT pin is in high impedance state, and charging will resume.		
		The temperature sense function can be disabled by grounding the TEMP pin.		
		Constant Charge Current Setting and Charge Current Monitor Pin. The		
		charge current is set by connecting a resistor R _{ISET} from this pin to GND.		
		When in precharge mode, the ISET pin's voltage is regulated to 0.2V. When in		
2	ISET	constant charge current mode, the ISET pin's voltage is regulated to 2V.In all		
		modes during charging, the voltage on ISET pin can be used to measure the		
		charge current as follows:		
		$I_{CH} = (V_{ISET} / R_{ISET}) \times 925$ R_{ISET} 's value can not be less than 2.5k .		
3	GND	Ground Terminal.		
	VIN	Positive Input Supply Voltage. V _{IN} is the power supply to the internal circuit.		
4		When V _{IN} drops to within 40mv of the BAT pin voltage, CN3051A/CN3052A		
		enters low power sleep mode, dropping BAT pin's current to less than 3uA.		
		Battery Connection Pin. Connect the positive terminal of the battery to BAT		
5	BAT	pin. BAT pin draws less than 3uA current in chip disable mode or in sleep		
3		mode. BAT pin provides charge current to the battery and provides regulation		
		voltage of 4.1V(CN3051A) or 4.2V(CN3052A).		
	FAULT	Open-Drain Fault Status Output. When the voltage at TEMP pin is below		
6		45% of $V_{\rm IN}$ or above 80% of $V_{\rm IN}$, this means that battery's temperature is too		
0		high or too low, FAULT is pulled low by an internal switch to indicate a		
		battery fault state; Otherwise FAULT pin is in high impedance state.		
	CHRG	Open Drain Charge Status Output. When the battery is being charged, the		
7		CHRG pin is pulled low by an internal switch, otherwise CHRG pin is in high		
		impedance state.		
		Chip Enable Input. A high input will put the device in the normal operating		
8	CE	mode. Pulling the CE pin to low level will put the CN3051A/CN3052A into		
		disable mode. The CE pin can be driven by TTL or CMOS logic level.		

Absolute Maximum Ratings

All Terminal Voltage 0.3V to 6.5V	Maximum Junction Temperature150
BAT Short-Circuit DurationContinuous	Operating Temperature 40 to 85
ESD Rating(HBM)2KV	Storage Temperature 65 to 150
Thermal Resistance (SOP8)TBD	Lead Temperature(Soldering)300

Stresses beyond those listed under 'Absolute Maximum Ratings' may cause permanent damage to the device. These are stress ratings only and functional operation of the device at these or any other conditions above those indicated in the operational sections of the specifications is not implied. Exposure to Absolute Maximum Rating Conditions for extended periods may affect device reliability.

Detailed Description

The CN3051A/CN3052A is a linear battery charger designed primarily for charging single cell lithium-ion or lithium-polymer batteries. Featuring an internal P-channel power MOSFET, the charger uses a constant-current/constant-voltage to charge the batteries. Charge current can be programmed up to 500mA with an external resistor. No blocking diode or sense resistor is required. The open-drain output CHRG and FAULT indicates the charger's status. The internal thermal regulation circuit reduces the programmed charge current if the die temperature attempts to rise above a preset value of approximately 115 . This feature protects the CN3051A/CN3052A from excessive temperature, and allows the user to push the limits of the power handling capability of a given circuit board without risk of damaging the CN3051A/CN3052A or the external components. Another benefit of adopting thermal regulation is that charge current can be set according to typical, not worst-case, ambient temperatures for a given application with the assurance that the charger will automatically reduce the current in worst-case conditions.

The charge cycle begins when the voltage at the V_{IN} pin rises above the UVLO level, a current set resistor is connected from the ISET pin to ground, and the CE pin is pulled above the chip enable threshold. The CHRG pin outputs a logic low to indicate that the charge cycle is ongoing. At the beginning of the charge cycle, if the battery voltage is below 3V, the charger is in precharge mode to bring the cell voltage up to a safe level for charging. The charger goes into the fast charge constant-current mode once the voltage on the BAT pin rises above 3V. In constant current mode, the charge current is set by R_{ISET}. When the battery approaches the regulation voltage, the charge current begins to decrease as the CN3051A/CN3052A enters the constant-voltage mode. When the current drops to charge termination threshold, the charge cycle is terminated, and CHRG pin assumes a high impedance state to indicate that the charge cycle is terminated. The charge termination threshold is 10% of the current in constant current mode. To restart the charge cycle, remove the input voltage and reapply it, or momentarily force CE pin to 0V. The charge cycle can also be automatically restarted if the BAT pin voltage falls below the recharge threshold. The on-chip reference voltage, error amplifier and the resistor divider provide regulation voltage with 1% accuracy which can meet the requirement of lithium-ion and lithium polymer batteries. When the input voltage is not present, the charger goes into a sleep mode, dropping battery drain current to less than 3uA. This greatly reduces the current drain on the battery and increases the standby time. The charger can be shutdown by forcing the CE pin to GND.

Application Information

Undervoltage Lockout (UVLO)

An internal undervoltage lockout circuit monitors the input voltage and keeps the charger in shutdown mode until $V_{\rm IN}$ rises above the undervoltage lockout voltage(4.0V typical). The UVLO circuit has a built-in hysteresis of 0.1V.

Sleep mode

There is an on-chip sleep comparator. The comparator keeps the charger in sleep mode if V_{IN} falls below sleep mode threshold(VBAT+40mv). Once in sleep mode, the charger will not come out of sleep mode until V_{IN} rises 90mv above the battery voltage.

Precharge mode

At the beginning of a charge cycle, if the battery voltage is below 3V, the charger goes into precharge mode, and the charge current is 10% of fast charge current in constant current mode.

Chip Enable/Disable

The CN3051A/CN3052A can be disabled by pulling the CE pin to less than 0.75V. For normal operation, pull the CE pin above 2.0V. Applying a voltage between 0.75V to 2.0V to this pin may cause larger operating current, and the CN3051A/CN3052A may be in uncertain state. When the chip is disabled, the internal linear regulator and the power MOSFET are turned off.

Programming Charge Current

The formula for the battery charge current in constant current mode is:

$$I_{CH} = 1850V / R_{ISET}$$

Where:

I_{CH} is the charge current in ampere

 $R_{\rm ISET}$ is the total resistance from the ISET pin to ground in ohm, $R_{\rm ISET}$'s value can not be less than 2.5k $\,$.

For example, if 500mA charge current is required, calculate:

$$R_{ISET} = 1850V/0.5A = 3.7k$$

For best stability over temperature and time, 1% metal film resistors are recommended. If the charger is in constant-temperature or constant voltage mode, the charge current can be monitored by measuring the ISET pin voltage, and the charge current is calculated as the following equation:

$$I_{CH} = (V_{ISET} / R_{ISET}) \times 925$$

USB and Wall Adapter Power

Although the CN3051A/CN3052A allows charging from a USB port, a wall adapter can also be used to charge Li-Ion/Li-polymer batteries. Figure 3 shows an example of how to combine wall adapter and USB power inputs. A P-channel MOSFET, M1, is used to prevent back conducting into the USB port when a wall adapter is present and Schottky diode, D1, is used to prevent USB power loss through the 1k pull-down resistor.

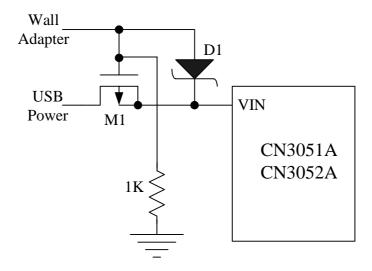

Figure 3 Combining Wall Adapter and USB Power

Battery Temperature Sense

To prevent the damage caused by the very high or very low temperature done to the battery pack, the CN3051A/CN3052A continuously senses battery pack temperature by measuring the voltage at TEMP pin determined by the voltage divider circuit and the battery's internal NTC thermistor as shown in Figure 1.

The CN3051A/CN3052A compares the voltage at TEMP pin (V_{TEMP}) against its internal V_{LOW} and V_{HIGH} thresholds to determine if charging is allowed. In CN3051A/CN3052A, V_{LOW} is fixed at (45% × VIN), while V_{HIGH} is fixed at (80% × VIN). If $V_{TEMP} < V_{LOW}$ or $V_{TEMP} > V_{HIGH}$ for 0.15 seconds, it indicates that the battery temperature is too high or too low and the charge cycle is suspended. When V_{TEMP} is between V_{LOW} and V_{HIGH} for more than 0.15 seconds, the charge cycle resumes.

The battery temperature sense function can be disabled by connecting TEMP pin to GND.

Recharge

After a charge cycle has terminated, if the battery voltage drops below the recharge threshold(4.0V for CN3051A, 4.1V for CN3052A), a new charge cycle will begin automatically.

Constant-Current/Constant-Voltage/Constant-Temperature

The CN3051A/CN3052A use a unique architecture to charge a battery in a constant-current, constant-voltage, constant temperature fashion as shown in Figure 2. Amplifiers Iamp, Vamp, and Tamp are used in three separate feedback loops to force the charger into constant-current, constant-voltage, or constant-temperature mode, respectively. In constant current mode the charge current delivered to the battery equal to 1850V/R_{ISET}. If the power dissipation of the CN3051A/CN3052A results in the junction temperature approaching 115 , the amplifier Tamp will begin decreasing the charge current to limit the die temperature to approximately 115 . As the battery voltage rises, the CN3051A/CN3052A either returns to constant-current mode or it enters constant voltage mode straight from constant-temperature mode.

Open-Drain Status Outputs

The CN3051A/CN3052A have 2 open-drain status outputs: CHRG and FAULT. CHRG is pulled low when the charger is in charging status, otherwise CHRG becomes high impedance. FAULT is pulled low if battery pack's temperature is in out of temperature condition for more than 0.15S, otherwise FAULT becomes high impedance. When the battery is not present, the charger charges the output capacitor to the regulation voltage quickly, then the BAT pin's voltage decays slowly to recharge threshold because of low leakage current at BAT pin, which results in a 100mv ripple waveform at BAT pin, in the meantime, CHRG pin outputs a pulse to indicate that the battery's absence. The pulse's frequency is around 10Hz when a 4.7uF output capacitor is used.

The open drain status output that is not used should be tied to ground.

V_{IN} Bypass Capacitor C_{IN}

Many types of capacitors can be used for input bypassing, C_{IN} is typically a 4.7uF capacitor.

Stability

Typically a 4.7uF capacitor in series with a 5% 0.3 resistor from BAT pin to GND is required to stabilize the feedback loop.

In constant current mode, the stability is also affected by the impedance at the ISET pin . With no additional capacitance on the ISET pin, the loop is stable with current set resistors values as high as 50K . However, additional capacitance on ISET pin reduces the maximum allowed current set resistor. The pole frequency at ISET pin should be kept above 200KHz. Therefore, if ISET pin is loaded with a capacitance C, the following equation should be used to calculate the maximum resistance value for $R_{\rm ISET}$:

$$R_{ISET} < 1 / (6.28 \times 2 \times 10^5 \times C)$$

In order to measure average charge current or isolate capacitive load from ISET pin, a simple RC filter can be used on ISET pin as shown in Figure 4.

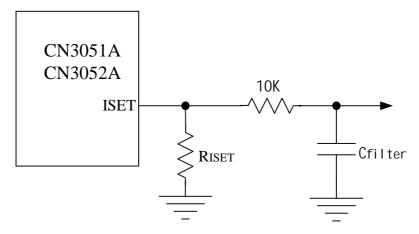

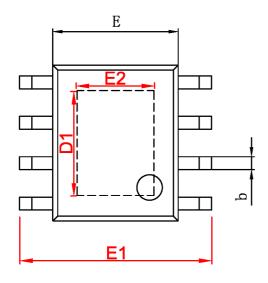

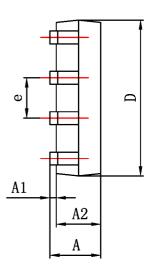

Figure 4 Isolating Capacitive Load on ISET Pin

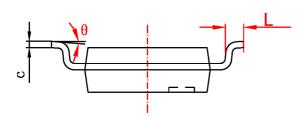

Board Layout Considerations

The ability to deliver maximum charge current under all conditions require that the exposed metal pad on the back side of the CN3051A/CN3052A package be soldered to the PC board ground. Failure to make the thermal contact between the exposed pad on the backside of the package and the copper board will result in larger thermal resistance.
