**关于电流、损耗角正切值、损耗功率**  
About the current, dissipation factor( $\tan\delta$ )、dissipated power

通过电容器的脉冲电流等于电容量与电压上升速率的乘积。  
The current ( $I$ ) is defined as voltage pulse slope( $dV/dt$ ) multiplied by the capacitance.

$$I = C \left( \frac{dV}{dt} \right)$$

损耗角正切值为加在电容器两端正弦波电压下有功功率与无功功率之比。

The dissipation factor( $\tan\delta$ ) is the ratio between the resistive and the reactive part of the impedance of the capacitor submitted to a sinusoidal voltage of specified frequency.

$$\tan\delta = \frac{R}{X} \quad (\text{in } Z=R+jX)$$

损耗功率可以用下式计算。

The dissipated power can be calculated as below.

$$P = \frac{\tan\delta}{\omega C} \times I^2 = ESR \times I^2$$

\*ESR : 表示特定频率下的等效电阻  
Equivalent series resistance at specified frequency
