

### HEXADECIMAL-TO-SEVEN SEGMENT LATCH/DECODER LED DRIVER

The MC14495-1 is constructed with CMOS enhancement-mode devices and NPN bipolar output drivers in a monolithic structure. The circuit provides the functions of a 4-bit storage latch. The decoder is implemented utilizing a mask-programmable ROM. With a 5-volt power supply, it can be used without resistor interface to drive seven segment LEDs. The series output resistors of, typically, 290 ohms are internal to the device.

Applications include MPU systems display driver, instrument display driver, computer/calculator display driver, cockpit display driver, and various clock, watch, and timer uses.

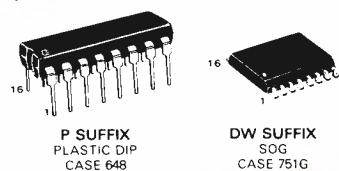

- Low Logic-Circuit Power Dissipation
- High Current-Sourcing Outputs with Internal Limiting Resistors
- Latch Storage of Code
- Supply Voltage Range = 4.5 to 18 V
- CMOS Input Switching Levels
- Standard ROM Provides Hex-to-Seven Segment Decoding
- Other ROM Options Available Upon Request (Contact your Motorola Sales Office)
- Chip Complexity: 187 FETs plus 9 NPNs or 49 Equivalent Gates

## MAXIMUM RATINGS (Voltages referenced to V<sub>SS</sub>).

| Rating  | Symbol               | Value                        | Unit |
|---|----------------------|------------------------------|------|
| DC Supply Voltage   | V <sub>DD</sub>      | -0.5 to +18                  | V    |
| Input Voltage, All Inputs   | V <sub>in</sub>      | -0.5 to V <sub>DD</sub> +0.5 | V    |
| DC Current Drain per Input Pin  | I                    | 10                           | mA   |
| Operating Temperature Range   | T <sub>A</sub>       | -40 to +85                   | °C   |
| Storage Temperature Range   | T <sub>stg</sub>     | -65 to +150                  | °C   |
| Maximum Continuous Output Power (Source) per Output @ 25°C<br>Pins 1, 2, 3, 12, 13, 14, 15<br>Pin 4 | P <sub>OHmax</sub> ‡ | 50<br>100                    | mW   |

‡ P<sub>OHmax</sub> = I<sub>OH</sub> (V<sub>DD</sub> - V<sub>O</sub>)

This device contains circuitry to protect the inputs against damage due to high static voltages or electric fields; however, it is advised that normal precautions be taken to avoid application of any voltage higher than maximum rated voltages to this high impedance circuit. For proper operation it is recommended that V<sub>in</sub> and V<sub>out</sub> be constrained to the range V<sub>SS</sub> ≤ (V<sub>in</sub> or V<sub>out</sub>) ≤ V<sub>DD</sub>.

#Data labelled "Typ" is not to be used for design purposes but is intended as an indication of the IC's potential performance.

**OUTPUT CIRCUIT**  
(Except Pin 11)

**INPUT/OUTPUT FUNCTIONS****SEGMENT DRIVER (a, b, c, d, e, f, g, h + i; PINS 12, 13, 14, 15, 1, 2, 3, 4)**

The segment drivers are emitter-follower NPN transistors. To limit the output current, a resistor, typically 290 ohms, is integrated internally at each output. Therefore, external resistors are not necessary when driving an LED at the supply voltage of  $V_{DD} = 5.0$  volts.

**OUTPUT (j; PIN 11)**

This open-drain output is activated (goes low) whenever inputs A, B, C, and D are all set to a logic one. Otherwise the output is in the high-impedance state. See the truth table.

**INPUT DATA (A, B, C, D; PINS 5, 6, 9, 10)**

The inputs A, B, C, and D are fed to a 4-bit latch which is controlled by the Latch Enable input.

**LATCH ENABLE (LE; PIN 7)**

The data on inputs A, B, C and D will pass through the latch and will be decoded immediately when LE is low. In this mode of operation the circuit is performing the function of a conventional decoder/driver. The data may be loaded into the latch when  $LE = \text{low}$  and will be latched with the rising edge of LE. The data will remain stored as long as LE is high.
