

Low Distortion 1.0 GHz Differential Amplifier

AD8350

FEATURES

High Dynamic Range

Output IP3: +22 dBm: Re 50 Ω @ 250 MHz

Low Noise Figure: 5.9 dB @ 250 MHz

Two Gain Versions:

AD8350-15 15 dB

AD8350-20 20 dB

-3 dB Bandwidth: 1.0 GHz

Single Supply Operation: +5 V to +10 V

Supply Current: 28 mA

Input/Output Impedance: 200 Ω

Single-Ended or Differential Input Drive

8-Lead SOIC Package

APPLICATIONS

Cellular Base Stations

Communications Receivers

RF/IF Gain Block

Differential A-to-D Driver

SAW Filter Interface

Single-Ended to Differential Conversion

High Performance Video

High Speed Data Transmission

FUNCTIONAL BLOCK DIAGRAMS

8-Lead SOIC Package (with Enable)

PRODUCT DESCRIPTION

The AD8350 series are high performance fully-differential amplifiers useful in RF and IF circuits up to 1000 MHz. The amplifier has excellent noise figure of 5.9 dB at 250 MHz. It offers a high output third order intercept (OIP3) of +22 dBm at 250 MHz. Gain versions of 15 dB and 20 dB are offered.

The AD8350 is designed to meet the demanding performance requirements of communications transceiver applications. It enables a high dynamic range differential signal chain, with exceptional linearity and increased common-mode rejection. The device can be used as a general purpose gain block, an A-to-D driver, and high speed data interface driver, among other functions. The AD8350 input can also be used as a single-ended-to-differential converter.

The amplifier can be operated down to +5 V with an OIP3 of +22 dBm at 250 MHz and slightly reduced distortion performance. The wide bandwidth, high dynamic range and temperature stability make this product ideal for the various RF and IF frequencies required in cellular, CATV, broadband, instrumentation and other applications.

The AD8350 is offered in an 8-lead single SOIC package. It operates from +5 V and +10 V power supplies, drawing 28 mA typical. The AD8350 offers a power enable function for power-sensitive applications. The AD8350 is fabricated using Analog Devices' proprietary high speed complementary bipolar process. The device is available in the industrial (-40°C to +85°C) temperature range.

ABSOLUTE MAXIMUM RATINGS*

Supply Voltage, V _S	+11 V
Input Power Differential	+8 dBm
Internal Power Dissipation	400 mW
θ _{JA}	100°C/W
Maximum Junction Temperature	+125°C
Operating Temperature Range	−40°C to +85°C
Storage Temperature Range	−65°C to +150°C
Lead Temperature Range (Soldering 60 sec)	+300°C

*Stresses above those listed under Absolute Maximum Ratings may cause permanent damage to the device. This is a stress rating only; functional operation of the device at these or any other conditions above those indicated in the operational section of this specification is not implied. Exposure to absolute maximum rating conditions for extended periods may effect device reliability.

PIN CONFIGURATION

PIN FUNCTION DESCRIPTIONS

Pin	Function	Description
1, 8	IN+, IN−	Differential Inputs. IN+ and IN− should be ac-coupled (pins have a dc bias of midsupply). Differential input impedance is 200 Ω.
2	ENBL	Power-up Pin. A high level (5 V) enables the device; a low level (0 V) puts device in sleep mode.
3	V _{CC}	Positive Supply Voltage. +5 V to +10 V.
4, 5	OUT+, OUT−	Differential Outputs. OUT+ and OUT− should be ac-coupled (pins have a dc bias of midsupply). Differential input impedance is 200 Ω.
6, 7	GND	Common External Ground Reference.

NOTES

¹13" Reels of 2500 each.

⁷²7" Reels of 750 each.

CAUTION

ESD (electrostatic discharge) sensitive device. Electrostatic charges as high as 4000 V readily accumulate on the human body and test equipment and can discharge without detection. Although the AD8350 features proprietary ESD protection circuitry, permanent damage may occur on devices subjected to high energy electrostatic discharges. Therefore, proper ESD precautions are recommended to avoid performance degradation or loss of functionality.

AD8350

APPLICATIONS

Using the AD8350

Figure 27 shows the basic connections for operating the AD8350. A single supply in the range +5 V to +10 V is required. The power supply pin should be decoupled using a 0.1 μF capacitor. The ENBL pin is tied to the positive supply or to +5 V (when $V_{CC} = +10\text{ V}$) for normal operation and should be pulled to ground to put the device in sleep mode. Both the inputs and the outputs have dc bias levels at midsupply and should be ac-coupled.

Also shown, in Figure 27, are the impedance balancing requirements, either resistive or reactive, of the input and output. With an input and output impedance of 200 Ω , the AD8350 should be driven by a 200 Ω source and loaded by a 200 Ω impedance. A reactive match can also be implemented.

Figure 28 shows how the AD8350 can be driven by a single-ended source. The unused input should be ac-coupled to ground. When driven single-ended, there will be a slight imbalance in the differential output voltages. This will cause an increase in the second order harmonic distortion (at 50 MHz, with $V_{CC} = +10\text{ V}$ and $V_{OUT} = 1\text{ V p-p}$, -59 dBc was measured for the second harmonic on AD8350-15).

Reactive Matching

In practical applications, the AD8350 will most likely be matched using reactive matching components as shown in Figure 29. Matching components can be calculated using a Smith Chart and the AD8350's S-Parameters (see Tables I and II) along with those of the devices that are driving and loading it. The S-Parameters in Tables I and II assume a differential source and load impedance of 50 Ω . Because the load impedance on the output of the AD8350 affects the input impedance, a simultaneous conjugate match must be performed to correctly match both input and output.

Figure 29. Reactively Matching the Input and Output

Figure 27. Basic Connections for Differential Drive

Figure 28. Basic Connections for Single-Ended Drive

Figure 30 shows how the AD8350 input can be matched for a single-ended drive. The unused input is ac-coupled to ground using a low impedance (i.e., high value) capacitance. The S-Parameters for this configuration are shown in Tables III and IV. These values assume a single-ended source impedance of $50\ \Omega$ and a differential load impedance of $50\ \Omega$. As in the case of a differential drive, a simultaneous conjugate match must be performed to correctly match both input and output.

Figure 30. Matching Circuit for Single-Ended Drive

Evaluation Board

Figure 31 shows the schematic of the AD8350 evaluation board as it is shipped from the factory. The board is configured to allow easy evaluation using single-ended $50\ \Omega$ test equipment. The input and output transformers have a 4-to-1 impedance ratio and transform the AD8350's $200\ \Omega$ input and output impedances to $50\ \Omega$. In this mode, $0\ \Omega$ resistors (R1 and R4) are required.

To allow compensation for the insertion loss of the transformers, a calibration path is provided at Test In and Test Out. This consists of two transformers connected back to back.

To drive and load the board differentially, transformers T1 and T2 should be removed and replaced with four $0\ \Omega$ resistors (0805 size); Resistors R1 and R4 ($0\ \Omega$) should also be removed. This yields a circuit with a broadband input and output impedance of $200\ \Omega$. To match to impedances other than this, matching components (0805 size) can be placed on pads C1, C2, C3, C4, L1 and L2.
