LTC1860/LTC1861

µPower, 12-Bit, 250ksps 1- and 2-Channel ADCs in MSOP

FEATURES

- **12-Bit 250ksps ADCs in MSOP Package**
- Single 5V Supply
- Low Supply Current: 850µA (Typ)
- Auto Shutdown Reduces Supply Current to 2µA at 1ksps
- True Differential Inputs
- 1-Channel (LTC1860) or 2-Channel (LTC1861) Versions
- SPI/MICROWIRE™ Compatible Serial I/O
- High Speed Upgrade to LTC1286/LTC1298
- Pin Compatible with 16-Bit LTC1864/LTC1865
- Guaranteed Operation to 125°C (MSOP Package)

APPLICATIONS

- High Speed Data Acquisition
- Portable or Compact Instrumentation
- Low Power Battery-Operated Instrumentation
- Isolated and/or Remote Data Acquisition

DESCRIPTION

The LTC®1860/LTC1861 are 12-bit A/D converters that are offered in MSOP and SO-8 packages and operate on a single 5V supply. At 250ksps, the supply current is only 850µA. The supply current drops at lower speeds because the LTC1860/LTC1861 automatically power down to a typical supply current of 1nA between conversions. These 12-bit switched capacitor successive approximation ADCs include sample-and-holds. The LTC1860 has a differential analog input with an adjustable reference pin. The LTC1861 offers a software-selectable 2-channel MUX and an adjustable reference pin on the MSOP version.

The 3-wire, serial I/O, MSOP or SO-8 package and extremely high sample rate-to-power ratio make these ADCs ideal choices for compact, low power, high speed systems.

These ADCs can be used in ratiometric applications or with external references. The high impedance analog inputs and the ability to operate with reduced spans down to 1V full scale, allow direct connection to signal sources in many applications, eliminating the need for external gain stages.

TYPICAL APPLICATION

Single 5V Supply, 250ksps, 12-Bit Sampling ADC
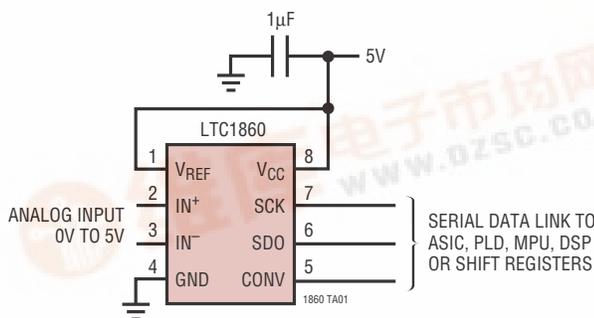

Supply Current vs Sampling Frequency

18601fa
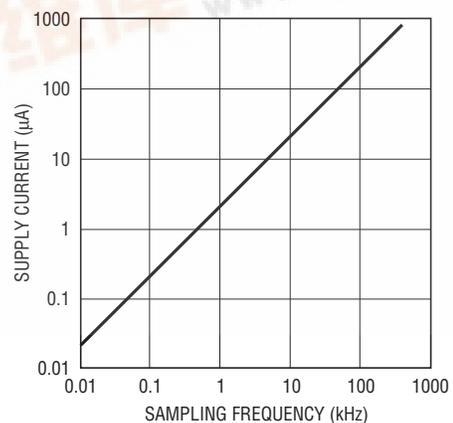

ABSOLUTE MAXIMUM RATINGS

(Notes 1, 2)

Supply Voltage (V_{CC}) 7V

Ground Voltage Difference
AGND, DGND LTC1861 MSOP Package.............±0.3V

Analog Input ....(GND – 0.3V) to (V_{CC} + 0.3V)

Digital Input .... (GND – 0.3V) to 7V

Digital Output ....(GND – 0.3V) to (V_{CC} + 0.3V)

Power Dissipation.. 400mW

Operating Temperature Range
LTC1860C/LTC1861C ....0°C to 70°C
LTC1860I/LTC1861I .... −40°C to 85°C
LTC1860H/LTC1861H.........................−40°C to 125°C

Storage Temperature Range...................–65°C to 150°C

Lead Temperature (Soldering, 10 sec) ....300°C

Note 1: Stresses beyond those listed under Absolute Maximum Ratings may cause permanent damage to the device. Exposure to any Absolute Maximum Rating condition for extended periods may affect device reliability and lifetime.

Note 2: All voltage values are with respect to GND.

Note 3: Integral nonlinearity is defined as deviation of a code from a straight line passing through the actual endpoints of the transfer curve. The deviation is measured from the center of the quantization band.

Note 4: Channel leakage current is measured while the part is in sample mode.

**Note 5:** Guaranteed by design, not subject to test.

PIN FUNCTIONS

LTC1860

V_REF (Pin 1): Reference Input. The reference input defines the span of the A/D converter and must be kept free of noise with respect to GND.

IN$^+$, IN$^-$ (Pins 2, 3): Analog Inputs. These inputs must be free of noise with respect to GND.

GND (Pin 4): Analog Ground. GND should be tied directly to an analog ground plane.

CONV (Pin 5): Convert Input. A logic high on this input starts the A/D conversion process. If the CONV input is left high after the A/D conversion is finished, the part powers down. A logic low on this input enables the SDO pin, allowing the data to be shifted out.

SDO (Pin 6): Digital Data Output. The A/D conversion result is shifted out of this pin.

SCK (Pin 7): Shift Clock Input. This clock synchronizes the serial data transfer.

V_CC (Pin 8): Positive Supply. This supply must be kept free of noise and ripple by bypassing directly to the analog ground plane.

LTC1861 (MSOP Package)

CONV (Pin 1): Convert Input. A logic high on this input starts the A/D conversion process. If the CONV input is left high after the A/D conversion is finished, the part powers down. A logic low on this input enables the SDO pin, allowing the data to be shifted out.

CH0, CH1 (Pins 2, 3): Analog Inputs. These inputs must be free of noise with respect to AGND.

AGND (Pin 4): Analog Ground. AGND should be tied directly to an analog ground plane.

DGND (Pin 5): Digital Ground. DGND should be tied directly to an analog ground plane.

SDI (Pin 6): Digital Data Input. The A/D configuration word is shifted into this input.

SDO (Pin 7): Digital Data Output. The A/D conversion result is shifted out of this output.

SCK (Pin 8): Shift Clock Input. This clock synchronizes the serial data transfer.

V_CC (Pin 9): Positive Supply. This supply must be kept free of noise and ripple by bypassing directly to the analog ground plane.

V_REF (Pin 10): Reference Input. The reference input defines the span of the A/D converter and must be kept free of noise with respect to AGND.

LTC1861 (SO-8 Package)

CONV (Pin 1): Convert Input. A logic high on this input starts the A/D conversion process. If the CONV input is left high after the A/D conversion is finished, the part powers down. A logic low on this input enables the SDO pin, allowing the data to be shifted out.

CH0, CH1 (Pins 2, 3): Analog Inputs. These inputs must be free of noise with respect to GND.

GND (Pin 4): Analog Ground. GND should be tied directly to an analog ground plane.

SDI (Pin 5): Digital Data Input. The A/D configuration word is shifted into this input.

SDO (Pin 6): Digital Data Output. The A/D conversion result is shifted out of this output.

SCK (Pin 7): Shift Clock Input. This clock synchronizes the serial data transfer.

V_CC (Pin 8): Positive Supply. This supply must be kept free of noise and ripple by bypassing directly to the analog ground plane. V_REF is tied internally to this pin.

APPLICATIONS INFORMATION

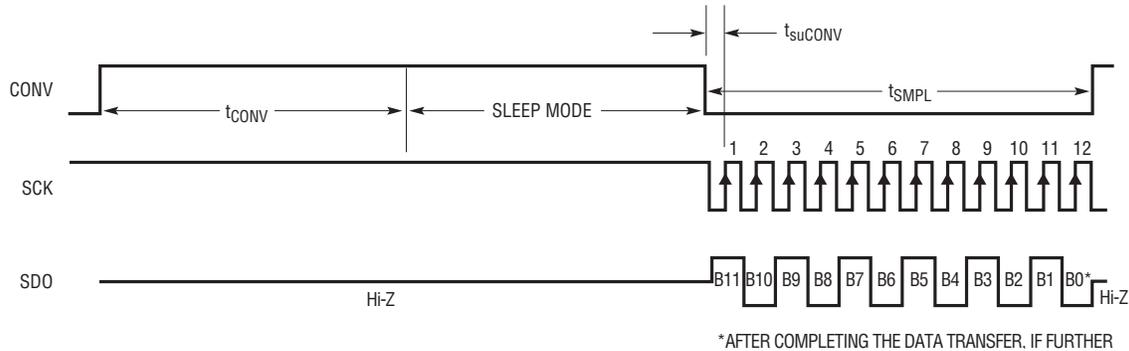

Figure 1. LTC1860 Operating Sequence

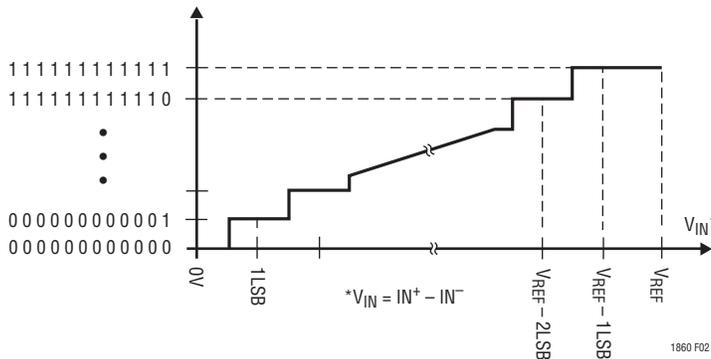

Figure 2. LTC1860 Transfer Curve
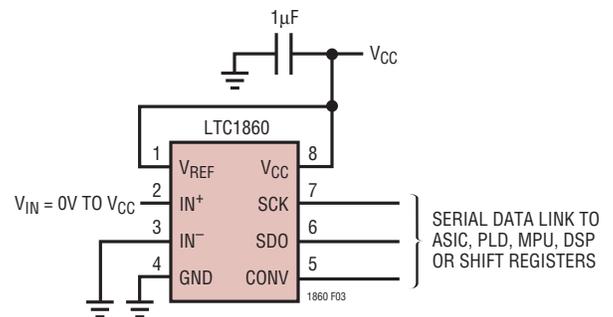

Figure 3. LTC1860 with Rail-to-Rail Input Span

LTC1860 OPERATION

Operating Sequence

The LTC1860 conversion cycle begins with the rising edge of CONV. After a period equal to t_{CONV}, the conversion is finished. If CONV is left high after this time, the LTC1860 goes into sleep mode drawing only leakage current. On the falling edge of CONV, the LTC1860 goes into sample mode and SDO is enabled. SCK synchronizes the data transfer with each bit being transmitted from SDO on the falling SCK edge. The receiving system should capture the data from SDO on the rising edge of SCK. After completing the data transfer, if further SCK clocks are applied with CONV low, SDO will output zeros indefinitely. See Figure 1.

Analog Inputs

The LTC1860 has a unipolar differential analog input. The converter will measure the voltage between the "IN+" and "IN–" inputs. A zero code will occur when IN+ minus IN– equals zero. Full scale occurs when IN+ minus IN– equals V_{REF} minus 1LSB. See Figure 2. Both the "IN+" and "IN–" inputs are sampled at the same time, so common mode noise on the inputs is rejected by the ADC. If "IN–" is grounded and V_{REF} is tied to V_{CC}, a rail-to-rail input span will result on "IN+" as shown in Figure 3.

Reference Input

The voltage on the reference input of the LTC1860 (and the LTC1861 MSOP package) defines the full-scale range of the A/D converter. These ADCs can operate with reference voltages from V_{CC} to 1V.

APPLICATIONS INFORMATION

*AFTER COMPLETING THE DATA TRANSFER, IF FURTHER SCK CLOCKS ARE
APPLIED WITH CONV LOW, THE ADC WILL OUTPUT ZEROS INDEFINITELY

186465 TBL1

LTC1861 OPERATION

Operating Sequence

The LTC1861 conversion cycle begins with the rising edge of CONV. After a period equal to t_{CONV}, the conversion is finished. If CONV is left high after this time, the LTC1861 goes into sleep mode. The LTC1861's 2-bit data word is clocked into the SDI input on the rising edge of SCK after CONV goes low. Additional inputs on the SDI pin are then ignored until the next CONV cycle. The shift clock (SCK) synchronizes the data transfer with each bit being transmitted on the falling SCK edge and captured on the rising SCK edge in both transmitting and receiving systems. The data is transmitted and received simultaneously (full duplex). After completing the data transfer, if further SCK clocks are applied with CONV low, SDO will output zeros indefinitely. See Figure 4.

Analog Inputs

The two bits of the input word (SDI) assign the MUX configuration for the next requested conversion. For a given channel selection, the converter will measure the voltage between the two channels indicated by the "+" and "–" signs in the selected row of the following table. In single-ended mode, all input channels are measured with respect to GND (or AGND). A zero code will occur when the "+" input minus the "–" input equals zero. Full scale occurs when the "+" input minus the "–" input equals V_{REF} minus 1LSB. See Figure 5. Both the "+" and "–" inputs are sampled at the same time so common mode noise is rejected. The input span in the SO-8 package is fixed at $V_{REF} = V_{CC}$. If the "–" input in differential mode is grounded, a rail-to-rail input span will result on the "+" input.

APPLICATIONS INFORMATION

Reference Input

The reference input of the LTC1861 SO-8 package is internally tied to V_{CC}. The span of the A/D converter is therefore equal to V_{CC}. The voltage on the reference input of the LTC1861 MSOP package defines the span of the A/D converter. The LTC1861 MSOP package can operate with reference voltages from 1V to V_{CC}.

GENERAL ANALOG CONSIDERATIONS

Grounding

The LTC1860/LTC1861 should be used with an analog ground plane and single point grounding techniques. Do not use wire wrapping techniques to breadboard and evaluate the device. To achieve the optimum performance, use a printed circuit board. The ground pins (AGND and DGND for the LTC1861 MSOP package and GND for the LTC1860 and LTC1861 SO-8 package) should be tied directly to the analog ground plane with minimum lead length.

Bypassing

For good performance, the V_{CC} and V_{REF} pins must be free of noise and ripple. Any changes in the V_{CC}/V_{REF} voltage with respect to ground during the conversion cycle can induce errors or noise in the output code. Bypass the V_{CC} and V_{REF} pins directly to the analog ground plane with a minimum of 1µF tantalum. Keep the bypass capacitor leads as short as possible.

Analog Inputs

Because of the capacitive redistribution A/D conversion techniques used, the analog inputs of the LTC1860/LTC1861 have capacitive switching input current spikes. These current spikes settle quickly and do not cause a problem if source resistances are less than 200Ω or high speed op amps are used (e.g., the LT®1211, LT1469, LT1807, LT1810, LT1630, LT1226 or LT1215). But if large source resistances are used, or if slow settling op amps drive the inputs, take care to ensure the transients caused by the current spikes settle completely before the conversion begins.
