

DS1488 Quad Line Driver

General Description

The DS1488 is a quad line driver which converts standard TTL input logic levels through one stage of inversion to output levels which meet EIA Standard RS-232D and CCITT Recommendation V.24.

Features

- Current limited output: ± 10 mA typ
- Power-off source impedance: 300Ω min
- Simple slew rate control with external capacitor
- Flexible operating supply range
- Inputs are TTL/LS compatible

Absolute Maximum Ratings (Note 2)

If Military/Aerospace specified devices are required, please contact the National Semiconductor Sales Office/Distributors for availability and specifications.

Supply Voltage

V⁺ +15V
V⁻ -15V

Input Voltage (V_{IN}) -15V ≤ V_{IN} ≤ 7.0V

Output Voltage ±15V

Operating Temperature Range 0°C to +75°C

Storage Temperature Range -65°C to +150°C

Maximum Power Dissipation (Note 1) at 25°C

Molded DIP Package 1280 mW

SO Package 974 mW

Lead Temperature (Soldering, 4 sec.) 260°C

Note 1: Derate molded DIP package 10.2 mW/°C above 25°C; derate SO package 7.8 mW/°C above 25°C.

Note 2: "Absolute Maximum Ratings" are those values beyond which the safety of the device cannot be guaranteed. Except for "Operating Temperature Range" they are not meant to imply that the devices should be operated at these limits. The table of "Electrical Characteristics" provides conditions for actual device operation.

Note 3: Unless otherwise specified min/max limits apply across the 0°C to +75°C temperature range for the DS1488.

Note 4: All currents into device pins shown as positive, out of device pins as negative, all voltages referenced to ground unless otherwise noted. All values shown as max or min on absolute value basis.

Applications

By connecting a capacitor to each driver output the slew rate can be controlled utilizing the output current limiting characteristics of the DS1488. For a set slew rate the appropriate capacitor value may be calculated using the following relationship

$$C = I_{SC} (\Delta T / \Delta V)$$

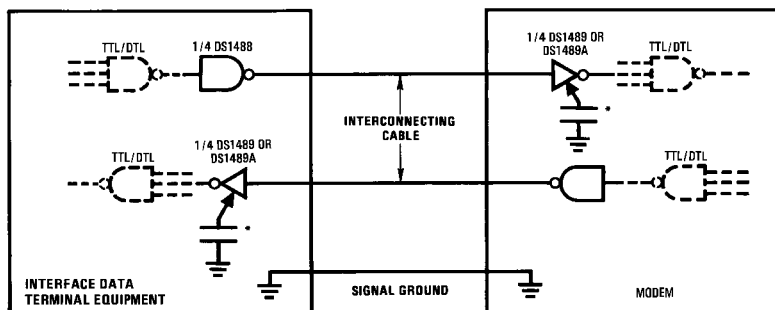

where C is the required capacitor, I_{SC} is the short circuit current value, and $\Delta V / \Delta T$ is the slew rate.

RS-232C specifies that the output slew rate must not exceed 30V per microsecond. Using the worst case output short circuit current of 12 mA in the above equation, calculations result in a required capacitor of 400 pF connected to each output.
