ECL Oscillators in 10 KH and 10E Logic

M F ECL oscillators, in 10 KH logic, with complementary outputs, and in the three most accepted pin-outs – all are made in the full size and half size DIL package in frequencies from 10 MHz to 396 MHz. Frequency tolerances from .02% to 25 ppm include all effects of voltage, load and aging.

The Series M1600, M1700, M1800 and M1900 have single outputs and the M2600, M2700, M2800 have dual-complementary outputs. These oscillators all have case tied to electrical ground.

Above 210 MHz, 10E logic is used.

- Three pin-outs for versatile compatibility
- Fixed single and complementary frequency to 410 MHz
- M1900 has Enable/Disable, reducing noise of unwanted frequency and allowing wired OR (to 210 MHz)
- DIL - full size or half size
- Start up time less than 5 ms.
- Stability options from .02% to .0025% (25 ppm)
- Guaranteed start-up with ramping DC Supply
- Specified for extended temperature to 85 deg. C, to allow for additional heat rise in confined space
- Terminating resistor may be internally factory-supplied

TERMINATIONS

All ECL oscillators must be terminated. If required, internal terminating resistors of any specified value may be factory-supplied.

ENABLE/DISABLE

The Series M1900 has an Enable-Disable feature, which allows several oscillators to be wire-OR'd, so that one frequency of several may be selected. If Pin 1. is "0", the output is normal. However, when Pin 1. is "1" the oscillator shuts-down, and the output goes to logic "0". The logic "0" may be wire-OR'd.

AUTOMATED TESTING (ATE)

Automated testing can effectively be performed using the M1900, since this model may be turned-off and "0" 'd, allowing a test frequency to be inserted on the output node.

T-90-20

Packaging and Environmental Information

DIL Package ("M" oscillators)

The most widely used package, this fits into the standard pin locations for a DIL 14 pin IC. Pin 1 is used in oscillators which have an additional output (duals and complementaries), or additional inputs (enable/disables, tristates and VCXO's).

Phase-Locked Loop VCXO (M2010 and M2015) package has a total of 7 pins, which are allow for 2 inputs and an additional B+ pin.

The HI-REL M5500 and M5516 use all 14 pins for additional mechanical strength in the connection to the PC board.

All cases are of stainless steel to prevent rust, and the platforms are corrosion-resistant nickel, or gold over nickel (ECL). The pins are solder plated, or gold over active nickel.

"M" Package

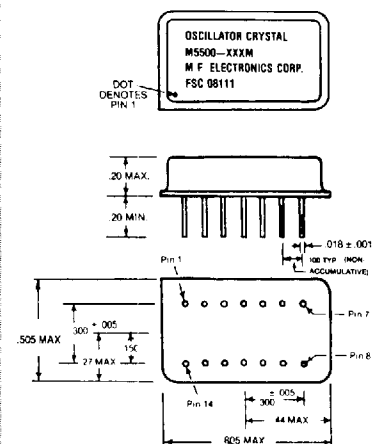

"M-1" Package M2010, M2015

"H" Package

"M-2" Package M5500, M5516

Packaging and Environmental Information

Surface-Mount Package ("S" oscillators)

The "S" package provides a surface-mount version of the most common TTL/HCMOS oscillators, including enable/disable and tristate. Similar to the PLCC 28, the package is a true J-lead with molded plastic on the outside and a true hermetic-seal inside.

The maximum overall size is .490 inches sq. and the height is 0.200 inch with lead location on .4 X .2 inch (5 X 10 mm) centers. The leads are alloy 42, with a nickel barrier and solder coat.

Unlike the "C" leads which cannot tolerate normal movement and flexing of the PC board, the MF package with J-leads effectively allows the part to float, when there are mechanical or thermal stresses in the PC board.

The "S" package is also superior to the half-can with gull-wings, because it designed from inside-out and can be easily handled by pick-and-place machines, either from tubes or tape-and-reel.
