

FEATURES

- **Slew Rate: 7V/ μ s Typ**
- **Gain-Bandwidth Product: 14MHz Typ**
- **Fast Settling to 0.01%**
 - 2V Step to 200 μ V: 900ns Typ
 - 10V Step to 1mV: 2.2 μ s Typ
- **Excellent DC Precision in All Packages**
 - Input Offset Voltage: 275 μ V Max
 - Input Offset Voltage Drift: 6 μ V/ $^{\circ}$ C Max
 - Input Offset Current: 30nA Max
 - Input Bias Current: 125nA Max
 - Open-Loop Gain: 1200V/mV Min
- **Single Supply Operation**
 - Input Voltage Range Includes Ground
 - Output Swings to Ground While Sinking Current
- **Low Input Noise Voltage: 12nV/ $\sqrt{\text{Hz}}$ Typ**
- **Low Input Noise Current: 0.2pA/ $\sqrt{\text{Hz}}$ Typ**
- **Specified on 3.3V, 5V and \pm 15V**
- **Large Output Drive Current: 20mA Min**
- **Low Supply Current per Amplifier: 1.8mA Max**
- **Dual in 8-Pin DIP and SO-8**
- **Quad in 14-Pin DIP and Narrow SO-16**

Note: For applications requiring higher slew rate, see the LT1213/LT1214 and LT1215/LT1216 data sheets.

 LTC and LT are registered trademarks of Linear Technology Corporation.

DESCRIPTION

The LT[®]1211 is a dual, single supply precision op amp with a 14MHz gain-bandwidth product and a 7V/ μ s slew rate. The LT1212 is a quad version of the same amplifier. The DC precision of the LT1211/LT1212 eliminates trims in most systems while providing high frequency performance not usually found in single supply amplifiers.

The LT1211/LT1212 will operate on any supply greater than 2.5V and less than 36V total. These amplifiers are specified on single 3.3V, single 5V and \pm 15V supplies, and only require 1.3mA of quiescent supply current per amplifier. The inputs can be driven beyond the supplies without damage or phase reversal of the output. The minimum output drive is 20mA, ideal for driving low impedance loads.

APPLICATIONS

- 2.5V Full-Scale 12-Bit Systems: $V_{OS} \leq 0.45\text{LSB}$
- 10V Full-Scale 16-Bit Systems: $V_{OS} \leq 1.8\text{LSB}$
- Active Filters
- Photo Diode Amplifiers
- DAC Current-to-Voltage Amplifiers
- Battery-Powered Systems

TYPICAL APPLICATION

Input Bias Current Cancellation

Input Current vs Input Voltage

LT1211/LT1212

ABSOLUTE MAXIMUM RATINGS

Total Supply Voltage (V^+ to V^-) 36V
 Input Current $\pm 15\text{mA}$
 Output Short-Circuit Duration (Note 1) Continuous
 Operating Temperature Range
 LT1211C/LT1212C -40°C to 85°C
 LT1211I/LT1212I -40°C to 85°C
 LT1211M -55°C to 125°C

Specified Temperature Range
 LT1211C/LT1212C/
 LT1211I/LT1212I (Note 5) -40°C to 85°C
 LT1211M -55°C to 125°C
 Storage Temperature Range -65°C to 150°C
 Junction Temperature (Note 2)
 Plastic Package (N8, S8, N, S) 150°C
 Ceramic Package (J8) 175°C
 Lead Temperature (Soldering, 10 sec) 300°C

ELECTRICAL CHARACTERISTICS

Note 1: A heat sink may be required to keep the junction temperature below absolute maximum when the output is shorted indefinitely.

Note 2: T_J is calculated from the ambient temperature T_A and power dissipation P_D according to the following formulas:

$$\text{LT1211MJ8, LT1211AMJ8: } T_J = T_A + (P_D \times 100^\circ\text{C/W})$$

$$\text{LT1211CN8, LT1211ACN8: } T_J = T_A + (P_D \times 100^\circ\text{C/W})$$

$$\text{LT1211CS8: } T_J = T_A + (P_D \times 150^\circ\text{C/W})$$

$$\text{LT1212CN: } T_J = T_A + (P_D \times 70^\circ\text{C/W})$$

$$\text{LT1212CS: } T_J = T_A + (P_D \times 100^\circ\text{C/W})$$

Note 3: This parameter is not 100% tested.

Note 4: Guaranteed by correlation to 3.3V and $\pm 15\text{V}$ tests.

Note 5: The LT1211C/LT1212C are guaranteed to meet specified performance from 0°C to 70°C and are designed, characterized and expected to meet these extended temperature limits, but are not tested at -40°C and 85°C . The LT1211I/LT1212I are guaranteed to meet the extended temperature limits.

Note 6: Slew rate is measured between $\pm 8.5\text{V}$ on an output swing of $\pm 10\text{V}$ on $\pm 15\text{V}$ supplies.

Note 7: Most LT1211/LT1212 electrical characteristics change very little with supply voltage. See the 5V tables for characteristics not listed in the 3.3V table.

Note 8: Guaranteed by correlation to 5V and $\pm 15\text{V}$ tests.

Note 9: Guaranteed by correlation to 3.3V tests.

APPLICATIONS INFORMATION

Supply Voltage

The LT1211/LT1212 op amps are fully functional and all internal bias circuits are in regulation with 2.2V of supply. The amplifiers will continue to function with as little as 1.5V, although the input common-mode range and the phase margin are about gone. The minimum operating supply voltage is guaranteed by the PSRR tests which are done with the input common mode equal to 500mV and a minimum supply voltage of 2.5V. The LT1211/LT1212 are guaranteed over the full -55°C to 125°C range with a minimum supply voltage of 2.5V.

The positive supply pin of the LT1211/LT1212 should be bypassed with a small capacitor (about $0.01\mu\text{F}$) within an inch of the pin. When driving heavy loads and for good settling time, an additional $4.7\mu\text{F}$ capacitor should be used. When using split supplies, the same is true for the negative supply pin.

Power Dissipation

The LT1211/LT1212 amplifiers combine high speed and large output current drive into very small packages. Because these amplifiers work over a very wide supply range, it is possible to exceed the maximum junction temperature under certain conditions. To insure that the LT1211/LT1212 are used properly, calculate the worst case power dissipation, define the maximum ambient temperature, select the appropriate package and then calculate the maximum junction temperature.

The worst case amplifier power dissipation is the total of the quiescent current times the total power supply voltage plus the power in the IC due to the load. The quiescent supply current of the LT1211/LT1212 has a positive temperature coefficient. The maximum supply current of each amplifier at 125°C is given by the following formula:

$$I_{\text{SMAX}} = 2.5 + 0.036 \cdot (V_{\text{S}} - 5) \text{ in mA}$$

V_{S} is the total supply voltage.

The power in the IC due to the load is a function of the output voltage, the supply voltage and load resistance. The worst case occurs when the output voltage is at half supply, if it can go that far, or its maximum value if it cannot reach half supply.

For example, calculate the worst case power dissipation while operating on $\pm 15\text{V}$ supplies and driving a 500Ω load.

$$I_{\text{SMAX}} = 2.5 + 0.036 \cdot (30 - 5) = 3.4\text{mA}$$

$$P_{\text{DMAX}} = 2 \cdot V_{\text{S}} \cdot I_{\text{SMAX}} + (V_{\text{S}} - V_{\text{OMAX}}) \cdot V_{\text{OMAX}}/R_{\text{L}}$$

$$\begin{aligned} P_{\text{DMAX}} &= 2 \cdot 15\text{V} \times 3.4\text{mA} + (15\text{V} - 7.5\text{V}) \cdot 7.5\text{V}/500 \\ &= 0.102 + 0.113 = 0.215\text{W per Amp} \end{aligned}$$

If this is the quad LT1212, the total power in the package is four times that, or 0.860W . Now calculate how much the die temperature will rise above the ambient. The total power dissipation times the thermal resistance of the package gives the amount of temperature rise. For this example, in the SO surface mount package, the thermal resistance is 100°C/W junction-to-ambient in still air.

$$\begin{aligned} \text{Temperature Rise} &= P_{\text{DMAX}} \cdot \theta_{\text{JA}} = 0.860\text{W} \cdot 100^{\circ}\text{C/W} \\ &= 86^{\circ}\text{C} \end{aligned}$$

The maximum junction temperature allowed in the plastic package is 150°C . Therefore the maximum ambient allowed is the maximum junction temperature less the temperature rise.

$$\text{Maximum Ambient} = 150^{\circ}\text{C} - 86^{\circ}\text{C} = 64^{\circ}\text{C}$$

That means the SO quad can only be operated at or below 64°C on $\pm 15\text{V}$ supplies with a 500Ω load.

As a guideline to help in the selection of the LT1211/LT1212, the following table describes the maximum supply voltage that can be used with each part based on the following assumptions:

1. The maximum ambient is 70°C or 125°C depending on the part rating.
2. The load is 500Ω , includes the feedback resistors.
3. The output can be anywhere between the supplies.

PART	MAX SUPPLIES	MAX POWER AT MAX T_{A}
LT1211MJ8	19.5V or $\pm 16.4\text{V}$	500mW
LT1211CN8	25.2V or $\pm 18.0\text{V}$	800mW
LT1211CS8	20.3V or $\pm 17.1\text{V}$	533mW
LT1212CN	21.0V or $\pm 17.8\text{V}$	1143mW
LT1212CS	17.3V or $\pm 14.4\text{V}$	800mW

APPLICATIONS INFORMATION

Inputs

Typically, at room temperature, the inputs of the LT1211/LT1212 can common mode 400mV below ground (V^-) and to within 1.2V of the positive supply with the amplifier still functional. However the input bias current and offset voltage will shift as shown in the characteristic curves. For full precision performance, the common-mode range should be limited between ground (V^-) and 1.5V below the positive supply.

When either of the inputs is taken below ground (V^-) by more than about 700mV, that input bias current will increase dramatically. The current is limited by internal 100 Ω resistors between the input pins and diodes to each supply. The output will remain low (no phase reversal) for inputs 1.3V below ground (V^-). If the output does not have to sink current, such as in a single supply system with a 1k load to ground, there is no phase reversal for inputs up to 8V below ground.

There are no clamps across the inputs of the LT1211/LT1212 and therefore each input can be forced to any voltage between the supplies. The input current will remain constant at about 60nA over most of this range. When an input gets closer than 1.5V to the positive supply, that input current will gradually decrease to zero until the input goes above the supply, then it will increase due to the previously mentioned diodes. If the inverting input is held more positive than the noninverting input by 200mV or more, while at the same time the noninverting input is within 300mV of ground (V^-), then the supply current will increase by 1mA and the noninverting input current will increase to about 10 μ A. This should be kept in mind in comparator applications where the inverting input stays above ground (V^-) and the noninverting input is at or near ground (V^-).

Output

The output of the LT1211/LT1212 will swing to within 0.60V of the positive supply with no load. The open-loop output resistance, when the output is driven hard into the

positive rail, is about 100 Ω as the output starts to source current; this resistance drops to about 25 Ω as the current increases. Therefore when the output sources 1mA, the output will swing to within 0.7V of the positive supply. While sourcing 20mA, it is within 1.1V of the positive supply.

The output of the LT1211/LT1212 will swing to within 3mV of the negative supply while sinking zero current. Thus, in a typical single supply application with the load going to ground, the output will go to within 3mV of ground. The open-loop output resistance when the output is driven hard into the negative rail is about 44 Ω at low currents and reduces to about 24 Ω at high currents. Therefore, when the output sinks 1mA, the output is about 42mV above the negative supply and while sinking 20mA, it is about 480mV above it.

The output of the LT1211/LT1212 has reverse-biased diodes to each supply. If the output is forced beyond either supply, unlimited currents will flow. If the current is transient and limited to several hundred mA, no damage will occur.

Feedback Components

Because the input currents of the LT1211/LT1212 are less than 125nA, it is possible to use high value feedback resistors to set the gain. However, care must be taken to insure that the pole that is formed by the feedback resistors and the input capacitance does not degrade the stability of the amplifier. For example, if a single supply, noninverting gain of two is set with two 20k resistors, the LT1211/LT1212 will probably oscillate. This is because the amplifier goes open-loop at 3MHz (6dB of gain) and has 50° of phase margin. The feedback resistors and the 10pF input capacitance generate a pole at 1.6MHz that introduces 63° of phase shift at 3MHz! The solution is simple; use lower value resistors or add a feedback capacitor of 10pF or more.

APPLICATIONS INFORMATION

Comparator Applications

Sometimes it is desirable to use an op amp as a comparator. When operating the LT1211/LT1212 on a single 3.3V or 5V supply, the output interfaces directly with most TTL and CMOS logic.

The response time of the LT1211/LT1212 is a strong function of the amount of input overdrive as shown in the

following photos. These amplifiers are unity-gain stable op amps and not fast comparators, therefore, the logic being driven may oscillate due to the long transition time. The output can be speeded up by adding 20mV or more of hysteresis (positive feedback), but the offset is then a function of the input direction.
