**MICROPOWER LOW-DROPOUT (LDO) VOLTAGE REGULATORS**

SLVS102G – MARCH 1995 – REVISED JUNE 2000

- Available in 5-V, 4.85-V, 3.3-V, 3.0-V, and 2.5-V Fixed-Output and Adjustable Versions
- Dropout Voltage <85 mV Max at  $I_O = 100$  mA (TPS7250)
- Low Quiescent Current, Independent of Load, 180  $\mu$ A Typ
- 8-Pin SOIC and 8-Pin TSSOP Package
- Output Regulated to  $\pm 2\%$  Over Full Operating Range for Fixed-Output Versions
- Extremely Low Sleep-State Current, 0.5  $\mu$ A Max
- Power-Good (PG) Status Output

## description

The TPS72xx family of low-dropout (LDO) voltage regulators offers the benefits of low-dropout voltage, micropower operation, and miniaturized packaging. These regulators feature extremely low dropout voltages and quiescent currents compared to conventional LDO regulators. Offered in small-outline integrated-circuit (SOIC) packages and 8-terminal thin shrink small-outline (TSSOP), the TPS72xx series devices are ideal for cost-sensitive designs and for designs where board space is at a premium.

A combination of new circuit design and process innovation has enabled the usual pnp pass transistor to be replaced by a PMOS device. Because the PMOS pass element behaves as a low-value resistor, the dropout voltage is very low – maximum of 85 mV at 100 mA of load current (TPS7250) – and is directly proportional to the load current (see Figure 1). Since the PMOS pass element is a voltage-driven device, the quiescent current is very low (300  $\mu$ A maximum) and is stable over the entire range of output load current (0 mA to 250 mA). Intended for use in portable systems such as laptops and cellular phones, the low-dropout voltage and micropower operation result in a significant increase in system battery operating life.

The TPS72xx also features a logic-enabled sleep mode to shut down the regulator, reducing quiescent current to 0.5  $\mu$ A maximum at  $T_J = 25^\circ\text{C}$ . Other features include a power-good function that reports low output voltage and may be used to implement a power-on reset or a low-battery indicator.

The TPS72xx is offered in 2.5-V, 3-V, 3.3-V, 4.85-V, and 5-V fixed-voltage versions and in an adjustable version (programmable over the range of 1.2 V to 9.75 V). Output voltage tolerance is specified as a maximum of 2% over line, load, and temperature ranges (3% for adjustable version).

D, P, OR PW PACKAGE  
(TOP VIEW)

† SENSE – Fixed voltage options only (TPS7225, TPS7230, TPS7233, TPS7248, and TPS7250)

‡ FB – Adjustable version only (TPS7201)

**Figure 1. Typical Dropout Voltage Versus Output Current**

Please be aware that an important notice concerning availability, standard warranty, and use in critical applications of Texas Instruments semiconductor products and disclaimers thereto appears at the end of this data sheet.

PRODUCTION DATA information is current as of publication date. Products conform to specifications per the terms of Texas Instruments standard warranty. Production processing does not necessarily include testing of all parameters.

## TPS72xx chip information

These chips, when properly assembled, display characteristics similar to the TPS72xxQ. Thermal compression or ultrasonic bonding may be used on the doped aluminum bonding pads. The chips may be mounted with conductive epoxy or a gold-silicon preform.

## functional block diagram

### RESISTOR DIVIDER OPTIONS

DEVICE	R1	R2	UNIT
TPS7201	0	∞	Ω
TPS7225	257	233	kΩ
TPS7230	357	233	kΩ
TPS7233	420	233	kΩ
TPS7248	726	233	kΩ
TPS7250	756	233	kΩ

NOTE A: Resistors are nominal values only.

### COMPONENT COUNT

MOS transistors	108
Bipolar transistors	41
Diodes	4
Capacitors	15
Resistors	75

§ Switch positions are shown with EN low (active).

¶ For most applications, SENSE should be externally connected to OUT as close as possible to the device. For other implementations, refer to the SENSE-pin connection discussion in application information section.

Output current, $I_O$		0	250	mA
Operating virtual junction temperature, $T_J$		-40	125	°C

$^\dagger$  Minimum input voltage defined in the recommended operating conditions is the maximum specified output voltage plus dropout voltage at the maximum specified load range. Since dropout voltage is a function of output current, *the usable range can be extended for lighter loads*. To calculate the minimum input voltage for the maximum load current used in a given application, use the following equation:

$$V_{I(\min)} = V_{O(\max)} + V_{DO(\max \text{ load})}$$

Because the TPS7201 is programmable,  $r_{DS(on)}$  should be used to calculate  $V_{DO}$  before applying the above equation. The equation for calculating  $V_{DO}$  from  $r_{DS(on)}$  is given in Note 3 under the TPS7201 electrical characteristics table. The minimum value of 3 V is the absolute lower limit for the recommended input-voltage range for the TPS7201.

$^\dagger$  CSR refers to the total series resistance, including the ESR of the capacitor, any series resistance added externally, and PWB trace resistance to  $C_O$ .

$^\ddagger$  Pulse-testing techniques are used to maintain virtual junction temperature as close as possible to ambient temperature; thermal effects must be taken into account separately.

$^\S$  This voltage is not recommended.

$^\P$  Output voltage programmed to 2.5 V with closed-loop configuration (see application information).

NOTES: 2. When  $V_I < 2.9$  V and  $I_O > 100$  mA simultaneously, pass element  $r_{DS(\text{on})}$  increases (see Figure 10) to a point such that the resulting dropout voltage prevents the regulator from maintaining the specified tolerance range.

3. To calculate dropout voltage, use equation:

$$V_{DO} = I_O \cdot r_{DS(\text{on})}$$

$r_{DS(\text{on})}$  is a function of both output current and input voltage. The parametric table lists  $r_{DS(\text{on})}$  for  $V_I = 2.4$  V, 2.9 V, 3.9 V, and 5.9 V, which corresponds to dropout conditions for programmed output voltages of 2.5 V, 3 V, 4 V, and 6 V, respectively. For other programmed values, refer to Figures 10 and 11.

‡ Pulse-testing techniques are used to maintain virtual junction temperature as close as possible to ambient temperature; thermal effects must be taken into account separately.

§ This voltage is not recommended.

¶ Output voltage programmed to  $2.5\text{ V}$  with closed-loop configuration (see application information).

NOTES: 2 When  $V_I < 2.9\text{ V}$  and  $I_O > 100\text{ mA}$  simultaneously, pass element  $r_{\text{DS(on)}}$  increases (see Figure 10) to a point such that the resulting dropout voltage prevents the regulator from maintaining the specified tolerance range.

3 To calculate dropout voltage, use equation:

$$V_{\text{DO}} = I_O \cdot r_{\text{DS(on)}}$$

$r_{\text{DS(on)}}$  is a function of both output current and input voltage. The parametric table lists  $r_{\text{DS(on)}}$  for  $V_I = 2.4\text{ V}$ ,  $2.9\text{ V}$ ,  $3.9\text{ V}$ , and  $5.9\text{ V}$ , which corresponds to dropout conditions for programmed output voltages of  $2.5\text{ V}$ ,  $3\text{ V}$ ,  $4\text{ V}$ , and  $6\text{ V}$ , respectively. For other programmed values, refer to Figures 10 and 11.

## APPLICATION INFORMATION

The design of the TPS72xx family of low-dropout (LDO) regulators is based on the higher-current TPS71xx family. These new families of regulators have been optimized for use in battery-operated equipment and feature extremely low dropout voltages, low supply currents that remain constant over the full-output-current range of the device, and an enable input to reduce supply currents to less than 0.5  $\mu\text{A}$  when the regulator is turned off.

### device operation

The TPS72xx uses a PMOS pass element to dramatically reduce both dropout voltage and supply current over more conventional PNP-pass-element LDO designs. The PMOS transistor is a voltage-controlled device that, unlike a PNP transistor, does not require increased drive current as output current increases. Supply current in the TPS72xx is essentially constant from no-load to maximum.

Current limiting and thermal protection prevent damage by excessive output current and/or power dissipation. The device switches into a constant-current mode at approximately 1 A; further load increases reduce the output voltage instead of increasing the output current. The thermal protection shuts the regulator off if the junction temperature rises above 165°C. Recovery is automatic when the junction temperature drops approximately 5°C below the high temperature trip point. The PMOS pass element includes a back diode that safely conducts reverse current when the input voltage level drops below the output voltage level.

A logic high on the enable input,  $\overline{\text{EN}}$ , shuts off the output and reduces the supply current to less than 0.5  $\mu\text{A}$ .  $\overline{\text{EN}}$  should be grounded in applications where the shutdown feature is not used.

Power good (PG) is an open-drain output signal used to indicate output-voltage status. A comparator circuit continuously monitors the output voltage. When the output drops to approximately 95% of its nominal regulated value, the comparator turns on and pulls PG low.

Transient loads or line pulses can also cause activation of PG if proper care is not taken in selecting the input and output capacitors. Load transients that are faster than 5  $\mu\text{s}$  can cause a signal on PG if high-ESR output capacitors (greater than approximately 7  $\Omega$ ) are used. A 1- $\mu\text{s}$  transient causes a PG signal when using an output capacitor with greater than 3.5  $\Omega$  of ESR. It is interesting to note that the output-voltage spike during the transient can drop well below the reset threshold and still not trip if the transient duration is short. A 1- $\mu\text{s}$  transient must drop at least 500 mV below the threshold before tripping the PG circuit. A 2- $\mu\text{s}$  transient trips PG at just 400 mV below the threshold. Lower-ESR output capacitors help by reducing the drop in output voltage during a transient and should be used when fast transients are expected.

A typical application circuit is shown in Figure 31.

**Figure 31. Typical Application Circuit**

### external capacitor requirements

Although not required, a 0.047-μF to 0.1-μF ceramic bypass input capacitor, connected between IN and GND and located close to the TPS72xx, is recommended to improve transient response and noise rejection. A higher-value electrolytic input capacitor may be necessary if large, fast-rise-time load transients are anticipated and the device is located several inches from the power source.

An output capacitor is required to stabilize the internal feedback loop. For most applications, a 10-μF to 15-μF solid-tantalum capacitor with a 0.5-Ω resistor (see capacitor selection table) in series is sufficient. The maximum capacitor ESR should be limited to 1.3 Ω to allow for ESR doubling at cold temperatures. Figure 32 shows the transient response of a 5-mA to 85-mA load using a 10-μF output capacitor with a total ESR of 1.7 Ω.

A 4.7-μF solid-tantalum capacitor in series with a 1-Ω resistor may also be used (see Figures 27 and 28) provided the ESR of the capacitor does not exceed 1 Ω at room temperature and 2 Ω over the full operating temperature range.

## APPLICATION INFORMATION

Figure 32. Load Transient Response (CSR total = 1.7 Ω), TPS7248Q

A partial listing of surface-mount capacitors usable with the TPS72xx family is provided below. This information (along with the stability graphs, Figures 27 through 30) is included to assist the designer in selecting suitable capacitors.

### CAPACITOR SELECTION

PART NO.	MFR.	VALUE	MAX ESR†	SIZE (H × L × W)†
592D156X0020R2T	Sprague	15 μF, 20 V	1.1	1.2 × 7.2 × 6
595D156X0025C2T	Sprague	15 μF, 25 V	1	2.5 × 7.1 × 3.2
595D106X0025C2T	Sprague	10 μF, 25 V	1.2	2.5 × 7.1 × 3.2
695D106X0035G2T	Sprague	10 μF, 35 V	1.3	2.5 × 7.6 × 2.5

† Size is in mm. ESR is maximum resistance in ohms at 100 kHz and  $T_A = 25^\circ\text{C}$ . Listings are sorted by height.

### sense-pin connection

SENSE must be connected to OUT for proper operation of the regulator. Normally this connection should be as short as possible; however, remote sense may be implemented in critical applications when proper care of the circuit path is exercised. SENSE internally connects to a high-impedance wide-bandwidth amplifier through a resistor-divider network, and any noise pickup on the PCB trace will feed through to the regulator output. SENSE must be routed to minimize noise pickup. Filtering SENSE using an RC network is not recommended because of the possibility of inducing regulator instability.

## APPLICATION INFORMATION

### output voltage programming

The output voltage of the TPS7201 adjustable regulator is programmed using an external resistor divider as shown in Figure 33. The output voltage is calculated using:

$$V_O = V_{\text{ref}} \cdot \left(1 + \frac{R_1}{R_2}\right) \quad (1)$$

Where:

$$V_{\text{ref}} = 1.188 \text{ V typ (the internal reference voltage)}$$

Resistors R1 and R2 should be chosen for approximately 7-μA divider current. Lower value resistors can be used but offer no inherent advantage and waste more power. Higher values should be avoided as leakage currents at FB increase the output voltage error. The recommended design procedure is to choose R2 = 169 kΩ to set the divider current at 7 μA and then calculate R1 using:

$$R_1 = \left(\frac{V_O}{V_{\text{ref}}} - 1\right) \cdot R_2 \quad (2)$$

**OUTPUT VOLTAGE

## APPLICATION INFORMATION

### power dissipation and junction temperature

Specified regulator operation is assured to a junction temperature of 125°C; the maximum junction temperature allowable to avoid damaging the device is 150°C. These restrictions limit the power dissipation that the regulator can handle in any given application. To ensure the junction temperature is within acceptable limits, calculate the maximum allowable dissipation,  $P_{D(max)}$ , and the actual dissipation,  $P_D$ , which must be less than or equal to  $P_{D(max)}$ .

The maximum-power-dissipation limit is determined using the following equation:

$$P_{D(max)} = \frac{T_{Jmax} - T_A}{R_{\theta JA}}$$

Where:

$T_{Jmax}$  is the maximum allowable junction temperature, i.e., 150°C absolute maximum and 125°C recommended operating temperature.

$R_{\theta JA}$  is the thermal resistance junction-to-ambient for the package, i.e., 172°C/W for the 8-terminal SOIC and 238°C/W for the 8-terminal TSSOP.

$T_A$  is the ambient temperature.

The regulator dissipation is calculated using:

$$P_D = (V_I - V_O) \cdot I_O$$

Power dissipation resulting from quiescent current is negligible.

### regulator protection

The TPS72xx PMOS-pass transistor has a built-in back diode that safely conducts reverse currents when the input voltage drops below the output voltage (e.g., during power down). Current is conducted from the output to the input and is not internally limited. If extended reverse voltage is anticipated, external limiting might be appropriate.

The TPS72xx also features internal current limiting and thermal protection. During normal operation, the TPS72xx limits output current to approximately 1 A. When current limiting engages, the output voltage scales back linearly until the overcurrent condition ends. While current limiting is designed to prevent gross device failure, care should be taken not to exceed the power dissipation ratings of the package. If the temperature of the device exceeds 165°C, thermal-protection circuitry shuts it down. Once the device has cooled, regulator operation resumes.

<sup>(1)</sup> The marketing status values are defined as follows:

**ACTIVE:** Product device recommended for new designs.

**LIFEBUY:** TI has announced that the device will be discontinued, and a lifetime-buy period is in effect.

**NRND:** Not recommended for new designs. Device is in production to support existing customers, but TI does not recommend using this part in a new design.

**PREVIEW:** Device has been announced but is not in production. Samples may or may not be available.

---

**OBSELETE:** TI has discontinued the production of the device.

(2) Eco Plan - The planned eco-friendly classification: Pb-Free (RoHS) or Green (RoHS & no Sb/Br) - please check <http://www.ti.com/productcontent> for the latest availability information and additional product content details.

**TBD:** The Pb-Free/Green conversion plan has not been defined.

**Pb-Free (RoHS):** TI's terms "Lead-Free" or "Pb-Free" mean semiconductor products that are compatible with the current RoHS requirements for all 6 substances, including the requirement that lead not exceed 0.1% by weight in homogeneous materials. Where designed to be soldered at high temperatures, TI Pb-Free products are suitable for use in specified lead-free processes.

**Green (RoHS & no Sb/Br):** TI defines "Green" to mean Pb-Free (RoHS compatible), and free of Bromine (Br) and Antimony (Sb) based flame retardants (Br or Sb do not exceed 0.1% by weight in homogeneous material)

(3) MSL, Peak Temp. -- The Moisture Sensitivity Level rating according to the JEDEC industry standard classifications, and peak solder temperature.

**Important Information and Disclaimer:** The information provided on this page represents TI's knowledge and belief as of the date that it is provided. TI bases its knowledge and belief on information provided by third parties, and makes no representation or warranty as to the accuracy of such information. Efforts are underway to better integrate information from third parties. TI has taken and continues to take reasonable steps to provide representative and accurate information but may not have conducted destructive testing or chemical analysis on incoming materials and chemicals. TI and TI suppliers consider certain information to be proprietary, and thus CAS numbers and other limited information may not be available for release.

In no event shall TI's liability arising out of such information exceed the total purchase price of the TI part(s) at issue in this document sold by TI to Customer on an annual basis.

## IMPORTANT NOTICE

Texas Instruments Incorporated and its subsidiaries (TI) reserve the right to make corrections, modifications, enhancements, improvements, and other changes to its products and services at any time and to discontinue any product or service without notice. Customers should obtain the latest relevant information before placing orders and should verify that such information is current and complete. All products are sold subject to TI's terms and conditions of sale supplied at the time of order acknowledgment.

TI warrants performance of its hardware products to the specifications applicable at the time of sale in accordance with TI's standard warranty. Testing and other quality control techniques are used to the extent TI deems necessary to support this warranty. Except where mandated by government requirements, testing of all parameters of each product is not necessarily performed.

TI assumes no liability for applications assistance or customer product design. Customers are responsible for their products and applications using TI components. To minimize the risks associated with customer products and applications, customers should provide adequate design and operating safeguards.

TI does not warrant or represent that any license, either express or implied, is granted under any TI patent right, copyright, mask work right, or other TI intellectual property right relating to any combination, machine, or process in which TI products or services are used. Information published by TI regarding third-party products or services does not constitute a license from TI to use such products or services or a warranty or endorsement thereof. Use of such information may require a license from a third party under the patents or other intellectual property of the third party, or a license from TI under the patents or other intellectual property of TI.

Reproduction of information in TI data books or data sheets is permissible only if reproduction is without alteration and is accompanied by all associated warranties, conditions, limitations, and notices. Reproduction of this information with alteration is an unfair and deceptive business practice. TI is not responsible or liable for such altered documentation.

Resale of TI products or services with statements different from or beyond the parameters stated by TI for that product or service voids all express and any implied warranties for the associated TI product or service and is an unfair and deceptive business practice. TI is not responsible or liable for any such statements.
